The average prices received today in two of the Eastern markets are as follows:

New York—Bartletts, $3; Lovells, 65c; Dukes $1.45; Susquehannas 70c; Giants $1.40; Tokays $2.25; Seediess $1.

Chicago—Bartietts, $2.70; peaches 65c to 80c; Tokays $2.50; Malagas $1.25; Gros $1.40; Giants $1.30; Grand Dukes $1.50; Hungarians $1.40.

Some of the heaviest prices ever received in the East for California fruit are reported by the Distributors. A carload of Bartletts from Colfax brought $1,560 in New York yesterday. Other carloads of the same fruit were sold at $1,400 and $1,453. A carload of Malaga grapes from Fresno brought $2,061, while a carload from Tarpey sold for $2,051.

**First Grape Shipment.**

The first straight carload of Tokay grapes was shipped through the California Fruit Distributors by the Valley Fruit Company from Florin August 17th. This fruit was loaded in car P F E 1234.

The second car of Tokay grapes this season was shipped by the California Fruit Exchange one day later.

It was reported today the first carload of Tokay grapes was shipped on August 18th. This is incorrect, the first shipment being made by the Distributors one day previous to this, according to the statement issued this afternoon.—Sacramento Bee.

## Citrus Market

LOS ANGELES, August 25, 1909.

The orange market is showing a materialy better condition this week. It has not only held last week's advance, but taken another advance of ten or fifteen cents. Good fruit of regular sizes is now commanding $3.00 f.o.b. Eastern points, and it is hoped that this may be maintained. One factor which lends a little uncertainty to the situation is that about September 1st Eastern peaches begin to come into market, and this year's output promises to be immense. How much this will affect the citrus market cannot be said. Valencias are now going forward at the rate of 50 or 60 cars per day.

Lemons are looking still better than last week though the intensely hot weather has been somewhat modified. Foreigns are still coming in as rapidly as prior to the new tariff, but the number now leaving Mediterranean ports is decreasing. The California pickers are finding the output materialy reduced. The total shipments will not exceed 20 cars per day, and often it is not over fifteen.

**Shipments.**

Total shipments of all citrus fruits since November 1st, 1908: 35,622 cars, of which 29,914 were oranges, and 5,708 lemons.

NEW YORK, Aug. 20.—Six cars oranges sold. Market steady. Weather clear and warm.

## CLIMATE IS NOT CHANGING.

One often hears the remark, "The climate is changing." This opinion is not confined to residents of Montana, who have become tired of the continued lack of warm weather and the snows and cold rains, but there are references to it in papers in the middle west and the east, says the Helena Record. Investigations by scientists have demonstrated that this opinion about the climate changing is not borne out by facts. They say that the life of man is too short to see any change in the climate of any section of the country. The weather in successive years may vary, there may be fewer months of cold and more of warm, but these are only variations, and climatic conditions—taking the average for a number of years, persist.

It is only a few years ago when the geographies marked a large area of western country as the "great American desert." What is that desert today? It is the most productive part of the country. Some will say the desert has been redeemed because the climate has changed. But that is not true. It is no longer a desert because man has found a way to make it produce. First he brought upon it the water from the streams and by giving the land a drink it became fertile. In more recent years he has found that where the moisture could not be introduced upon the land by artificial means, he could by cultivation and scientific farming conserve the natural moisture and so make it productive.

In no state has this change, not in climatic conditions, but in methods of cultivation, been more forcibly demonstrated than in Montana. Who is there who ten years ago would have said that the vast areas then given over to cattle and sheep, would in this year of our Lord be producing crops of grain averaging per acre twenty or thirty bushels more than the rich lands of the middle west? Not one. Yet there have been no distinct climatic changes. It is simply that men have learned to do things which before they did not know.—Scientific Farmer.

The Cucamonga Lemon Association has authorized a Los Angeles architect to prepare plans for a lemon packing house 100x120 feet, which it is claimed will be fire proof and afford better packing facilities than most lemon houses.

## INTERESTING EXPERIMENTS WITH WHEAT.

If wheat from the same sample were to be planted in Kansas and in California, and the results were different, the difference might be ascribed (1) to the difference in soil, (2) to the difference in climate, or (3) to both together. But if a sample of Kansas soil were to be brought to California and seeded to wheat, the difference between the two wheats grown in California must be due to the soils, since the climate is identical. Conversely any difference between Kansas-grown wheat and that grown in California on Kansas soil must be due to the climate, since the soils are the same.

Such an experiment is now being tried by the Experimental Agronomy Department at the University Farm near Davis, under a state appropriation. Two-ton samples of soil have been exchanged with Kansas and Maryland, and planted with Durum wheat; and the effects of soil and climate, respectively, upon the gluten contents of the wheat kernel are being carefully studied through collation of the results obtained at all three stations. The soil samples make plats about five feet square and three feet deep.

Conclusive results have not yet been obtained from these experiments. Even when the results are read, they will be of little immediate practical value to the individual farmer. But the Agricultural Department of the University, by correlating these investigations into the influence of soil and climate upon the composition of grains with the results of fertilizer tests, rotation experiments, and other studies, will have the necessary scientific basis from which to reason in its work of directing the agricultural development of the state. Ultimately the results of such experiments will come to the individual farmer in such form as will help him to make the fullest and most economical use of all the resources of soil and climate which are at his disposal.

A florist says the best way to water plants is to immerse the pot in water, letting it rise an inch or two above the top of the pot. When the bubbles cease to rise it is a sign that not a dry spot is left in the earth. The fault with the ordinary method of watering is said to be that the water does not thoroughly penetrate the earth, the roots remaining dry, while the top is moist. The plants should be watered only when they seem dry.

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it falls to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

# Eucalypts Valuable for Ornamental Purposes

A List of Desirable Ornamental Eucalypts. Written for the Cultivator

By LEONARD COATES of Morganhill

AMIDST all the literature published on that most useful species, the Eucalyptus, the great value of these trees for ornamental purposes is almost overshadowed in the overwhelming testimony on the strictly economic standpoint.

Southern California is far ahead of the more northern portions of the state in the matter of the study and practise of landscape gardening, and especially so in the knowledge and selection of those trees which are best suited to existing conditions. However, the state is so wide, and soils and climates so varied that it were impossible to cover so great a subject in any series of short articles.

**Right Selection.**

The objection is often raised that the Eucalypt is too rank a grower for street planting; that it overshadows all else, monopolizes the soil to the detriment of other trees or plants; lifts the cement sidewalk, stops up sewer pipes and in other ways makes itself a public nuisance. The answer to this is that the slower growing species should be used for town ornamentation, instead of globulus, viminalis, rudis, and some others, which are those almost invariably used on the streets, and which give reason for the criticisms alluded to.

**Australian Beech.**

Eucalyptus polyanthema, known sometimes as "Australian Beech," may perhaps be placed at the head of the list for ornamental purposes, and as being adapted to a great variety of climatic conditions. The leaves are roundish, becoming ovate, and of a beautiful grey-blue tint. The flowers are small, white, in dense panicles, resembling somewhat a gigantic head of mignonette.

Bees are very fond of them, the polyanthema being one of the most useful honey producers. Growth is not rapid. and with annual trimming the trees may easily be kept in any desired shape. This point should be emphasized, as the erroneous custom is so often to allow a street tree of whatever kind to grow until it infringes on some municipal ordinance, or gets in the way of the telephone wires, with like disastrous results, for there is not much choice between the "pruning" of the lineman and of the so-called "gardener." "Little and often" should ze the rule in trimming street trees.

Eucalyptus leucoxylon-rosea is another very hardy and beautiful eucalypt; in foliage not so striking as the former, but bearing profuse clusters of rosy-pink flowers. It is slow growing, and of dwarf habit, bark smooth.

**Sugar Gum.**

Eucalyptus corynocalyx, or sugar gum, is much more rapid in growth, and one of the most valuable species for timber, in the coast region. It is of a denser habit than most others, with very beautiful, dark green, glossy foliage. No Eucalypt withstands wind better than the sugar gum, and it is in every way unsurpassed, if equalled, as an avenue tree, but requires more room than polyanthema.

**Beautiful Flowers.**

Eucalyptus ficifolia, (crimson flowered gum),

Foliage of Polyanthema.

is perhaps the most beautiful of the whole family, at least so far as its very showy flowers are concerned. It is slow growing, and delights in a warm, sunny climate, not standing much frost without injury. The seeds are large, slow of germinating, very expensive, and the young seedlings extremely liable to "damping-off."

**For the Coast.**

Eucalyptus calophylla. This is a strong and vigorous species, adapted only to the coast region, or where frosts are never severe. Its foliage is exceedingly handsome, more "umbrageous" in habit than any other. Flowers are large, white, or pinkish.

A variety, called calophylla-rosea, has beautiful pink flowers; it is quite scarce, and available only as individual specimens.

**Lemon Scented.**

Eucalyptus citriodora, or lemon-scented gum, is well known in Southern California. It should be in every collection, as it will thrive in most parts of Califoria in protected places, near the house. Its delicately scented leaves make it a universal favorite.

**Hardy.**

Angustifolia is a variety of amygdalina, with very delicate, graceful foliage, striking in effect, and quite distinct; it is perfectly hardy anywhere in California.

**A Dwarf.**

Eucalyptus lehmanni is noticeable because of its spreading, dwarfish habit. It has very large, greenish flowers, giving a most striking effect. Its spreading nature makes it desirable for grouping, or for wind-breaks; it is quite hardy.

**Not a Eucalypt.**

Syncarpia laurifolia belongs to the Myrtle order, and is sometimes classed with Eucalypts. In Australia it grows to a great size, is rather tender; its timber is of great value, and the tree very beautiful; it is known as Turpentine tree.

Another closely allied tree is Angophora subvelutina, "apple tree," which, while young at least, is attractive and worthy a place in every collection.

Eucalyptus occidentalis and Eucalyptus erythonema are said to be highly ornamental; the young seedlings are beautiful, as they are growing in our plantations.

**Suited to Your Conditions.**

The whole secret of successful planting, whatever may be the ultimate object, is the suitability of the plant or tree to the conditions and environment.

**Beauty has Commercial Value.**

The culture of the Eucalypt is an all-absorbing topic, and there is no gainsaying the statement that this tree, planted in proper commercial form, is likely to become one of the most valuable assets of the State of California, and of no less value to the United States. I believe in exploiting the economic values of trees, but who is it "with soul so dead" that he cannot see something of the beauty of certain eucalypts, fittingly grouped and properly planted; or of the added glories of California when her barren hills shall be clothed or re-clothed with the everlasting verdure of their "aspiring branches," with their "scythe-shaped leaves, trembling beneath the slightest breeze?"—Leonard Coates. Morganhill. August, 1909.

## THE MANGO IN HAWAII.

THAT both the mango and alligator pear can be raised commercially in Hawaii at a profit is the belief of J. E. Higgins, of the Federal Experiment Station there. In a recent talk with the members of the Hawaii Promotion Committee Mr. Higgins said:

"The problems of budding both the mango and the alligator pear, have now been solved, and the way is now clear for the development of the mango and pear industry in Hawaii on the same scale as the orange industry has been developed in Southern California.

"We have been working all this year on the mango budding. Budding is necessary because the seeds of the mango cannot be depended upon to produce the same high grade of fruit as does the tree from which they are taken."

"The method that has been in vogue in the propagation of mangoes for a long time is that known as arching, or grafting an approach. With a fine mango tree of known producing qualities in a garden, we take a seedling in a pot, place it beneath a branch of the choice tree, make an incision in the bark of the tree and in the bark of the seedling, and bind the wounds together. In a few weeks we find that they have grown together. The seedling, with its bud, is then cut away from the parent tree, all of the growth above the bud is pruned off; and there is then a certainty that the fruit produced from the bud will be of the same quality as that of the tree which furnished the bud.

"This method works all right with an occasional garden tree, but it is manifestly out of the question when many trees have to be budded. Therefore it was necessary to look about for another method.

"The next plan tried was to cut a bud from a known tree, cut out a like bud from a seedling, insert the bud in the opening on the seedling and bind the two together. This method is thoroughly satisfactory when both the bud wood and the seedling are in the proper stage of growth. Were it only necessary to wait for the seedling or the bud wood to reach the proper stage, all would be well, but the necessity of waiting for time when both shall be ready makes this method impracticable for general use.

"Another objection to this method is the inability to get bud wood from a distance and be sure that it will be in the proper state for budding.

"So then we tried the oldest method of budding known, one that, so far as I know, had never been tried with the mango. A piece of bud wood is secured, the bud is cut out. The wood from the back of the bud is then stripped away. Next an incision is made in the bark of the seedling tree, the opening T-shaped with the horizontal line at the bottom. The bud is inserted, taking care to see that it is right side up, the wound is bound up with palm fiber, binding wax is used, and finally the whole is bound round with adhesive tape.

"After the bud has been in place for about a month, the top of the seedling is cut about three-quarters through, some eight inches above the the bud. This allows the upper part to bend over, but it yet retains sufficient vitality to draw the sap up from the roots. When the bud is well started, the top is cut off entirely, and after say six months, the stump is pruned down next the bud. In due time the stump will heal over so that there will be practically no trace of the wound made by the budding.

"As far as propagation is concerned, I should have no more hesitancy at going into the business of orcharding mangoes on a large scale than I should with regard to oranges in Southern California. We have here some of the finest mangoes in the world. We have mangoes which can be opened and the seed taken out with as great facility as can that of the alligator pear. We know that the mango can be shipped even better than can the alligator pear.

"I agree with the suggestion made by Mr. Wood that the mango should become to Hawaii what the orange is to Southern California. What I have said of the mango applies also to the alligator pear.

"I know that the aligator pear can be budded, though we have not yet been as uniformly successful as with the mango.

"Mangoes have been grown at elevations greater then one thousand feet and I believe that any soil that does not go to extremes is suitable. With regard to irrigation, even the young trees require less water than oranges. There is not one commercial nursery in Hawaii. A splendid opening for a man of experience and with sufficient capital to start right.

"As far as soil, altitude and irrigation are concerned the alligator pear will thrive under the same conditions as the mango. The alligator pear might well be raised here commercially at a profit. There is an immense amount of untilled land in the Territory admirably suited for the purpose.

"I should not hesitate advising any person with the necessary capital to start an alligator pear orchard of, say, ten acres as a commercial proposition. Of course a man would have to wait for his trees to mature before expecting any profit, just as is the case with oranges, lemons and commercial orchards of other fruits."

## ARTESIAN FLOWS.

Within the walls of an old Carthusian convent at Lillers, in the ancient province of Artois, France, is a well that has flowed steadily ever since it was bored in the year 1126, and this is but one of many flowing wells in the province whose name has furnished the term "artesian." Nearly equal in antiquity with the flowing wells of Artois are those of Modena in northern Italy, which were held in such repute that two well borer's augers were made the coat of arms of the town, and the first certain statement in literature concerning the employment of the miner's drill in sinking wells is probably that published in 1691 by Bernardini Ramazzini, a professor of medicine at Modena. Indeed, this town might well have disputed with Artois the right to give name to flowing wells.

**Later Well Drilling in the Old World.**

That artesian waters were discov-

ered at such early dates may, however, be attributed to happy chances. The modern history of flowing wells began only when geology was ready to point out the necessary disposition of rock strata and the art of drilling was mastered. In the early part of the last century improved machinery for drilling was invented, and much attention was devoted to the subject. In France popular interest in these wells was so great that for a number of years the Royal and Central Society of Agriculture each year distributed medals and prizes (the highest was 3000 francs) to workers in the field—to authors, inventors, well drillers, and to those who succeeded in obtaining wells in regions where they were not before known. Many flowing wells were drilled in other countries, as in England, for example, but the chief honors for the advancement of the science belong without question to the French savants and mechanicians.

**Artesian Well Districts in the United States.**

One of the earliest artesian wells in the United States was that sunk at Fort Monroe, Va., in 1845. Its depth, however, was not very great—only 168 feet. Another early well was the one begun at St. Louis in the spring of 1849 and finished five years later, when it had reached a depth of 2199 feet. Since 1860 thousands of deep wells have been bored in the United States, the most important artesian districts being those of South Dakota, Texas, and Southern California.

Every text-book on geology and every treatise on hydraulics discusses the occurrence of artesian waters. A paper by Prof. T. C. Chamberlin, on the "Requisite and qualifying conditions of artesian flows," published in the Fifth Annual Report of the United States Geological Survey, has become classic. In no science is it more generally recognized that Nature does not do her work in the simplest way than in geology.

## CONSERVE MOISTURE.

It will be necessary to practice great care in the conservation of moisture to make it possible for a tree to grow and produce fruit in many sections. This is to be considered as a most important phase. We must make use of all the moisture that falls, and make use of every practice that will conserve this moisture.

A certain amount of well rotted manure added to the land will help hold the moisture much better than where no manure is used. Almost every farmer and fruit grower is familiar with the methods of tillage that conserve moisture. Deep, thorough tillage in spring and constant shallow tillage during the summer will do more to make fruit grow in these dry sections than any other phase of cultivation.

Thus by the addition of well rotted manure, or the growing of cover crops until the ground is in good condition, and carefully conserving the moisture that falls, or can be secured, much fruit can be raised where none has been raised in the past.

Following closely upon the management and care of these fruit plantations, we must select such varieties of fruits as will mature before the very dry part of the summer comes on, or such varieties as will stand an unusual amount of drouth.—Irrigation Age.

## SCHOOL OF AGRICULTURE.

The School of Agriculture at Davis, which first opened for instruction in January of the present year, will begin its second term's work on September 20th. Several additions have been made to the teaching staff for the coming year.

Miss Katharine Winans will be Matron of the School, and will have charge of the dormitory, and of the new dining-hall now being erected. The social life of the School centers around the dormitory, and thus the position of matron is a most important one. Miss Winans has ability, tact and experience, and will fill the place very successfully.

Under present conditions, only boys can be received as students at the Schools of Agriculture. Applicants for entrance to the School should have completed the work of the eighth grade in the public schools, and should be at least fifteen years of age. The course of study is for three years of eight months each It gives practical training in up-to-date scientific methods of agriculture; a large proportion of the instruction is in field and laboratory. To supply further information about the School, a circular has been prepared, and will be sent upon application to the Principal, at Davis.

## DRY FARMING HANDBOOK.

The official Proceedings of the Third Annual Session of the Dry Farming Congress held in Cheyenne last February, have been published. Throughout the book is found information invaluable to all who are situated in arid sections not supplied with irrigation; and even to the irrigators there is much of value. The book has almost 400 pages, and includes the report of the statistician of the congress. It is furnished free to all members of the congress; to others at a cost of one dollar. The Secretary of the Dry Farming Congress is John T. Burns, Billings, Montana.

## LAST SEASON'S FLORIDA ORANGE CROP.

The editor some time since made application to the transportation companies handling the orange crop out of Florida for estimates of the size of the orange crop for the season of 1908-09, based on the number of boxes moved by them up to June 1, 1909. These figures have just been received by us and total slightly in excess of 5,000,100 boxes. This estimate is as nearly correct as it is possible to obtain.—Florida Fruit News.

## FOREST RESERVES IN THE U. S.

The following table shows the number and the area of the timber reserves in the United States:

| States | Number | Acres |
|---|---|---|
| Alaska | 2 | 4,909,880 |
| Arizona | 10 | 8,357,370 |
| California | 17 | 18,155,043 |
| Colorado | 14 | 12,661,643 |
| Hawaii | 5 | 56,757 |
| Idaho | 9 | 9,488,324 |
| Kansas | 1 | 97,280 |
| Montana | 10 | 10,517,860 |
| Nebraska | 2 | 208,902 |
| Nevada | 1 | 59,115 |
| New Mexico | 5 | 5,207,184 |
| Oklahoma | 1 | 57,120 |

## PICKING AND MARKETING PEARS.

THE methods used in marketing pears vary so greatly in different parts of the country that it would be impossible to describe them all in detail. It is only possible, therefore, to give certain general considerations in regard to the matter.

**In California.**

The season of the year, whether summer or winter, the distance from market, the purpose for which the fruit is intended, as well as many other conditions peculiar to the markets of different cities, all have their effect in determining the methods used by the successful pear grower. The California grower packs his pears, mostly wrapped in paper, in neatly constructed boxes, shipping them in carload lots to New York, Boston, or other eastern cities, or perhaps to London. The fruit is sorted and packed directly after it is picked from the trees, and is expected to ripen in transit and open up in prime condition for eating 3,000 miles or more from the orchard.

**Gulf States.**

The grower of the Le Conte and Kieffer Pear in the Gulf States also packs his fruit by wholesale methods, using barrels or boxes, and ships it in carload lots, or sometimes even in train lots to northern cities. On the other hand, the eastern gardener may ripen up a few bushels in his house and deliver them direct to his retail or wholesale customers. Large quantities of pears are consumed by the canneries, both of the Pacific coast and in the eastern states. The large crop of Kieffers, which is now getting to be such an important factor in the pear market of eastern cities during the autumn months, is very largely taken up by the canneries, especially in Baltimore, and the trade in canned Kieffer pears is very rapidly increasing. For the canning trade the pears are almost always shiped in baskets of the type of the Maryland and Delaware peach basket, and the baskets are generally returned to the grower to be used over and over again. The price paid is usually so low that the cost of the baskets is an important item if they are not returned. The price is often as low as 15 to 20 cents a half-bushel basket and 25 to 30 cents is considered a good price. Kieffer-pear growing is immensely profitable. This can be readily understood when we realize that the yield is often more than 1,000 baskets per acre.

**Time of Picking.**

One important point for the inexperienced pear grower to determine is the exact time for picking the fruit. The pear is quite exceptional as compared with the ordinary orchard fruits in that it is much better if picked from the tree before it is ripe, and then ripened up either closely packed in a box or stored in large quantities in a tight room.

Very few pears are at their best if allowed to ripen on the tree. As

choice a pear as Clapp's Favorite, becomes dry and mushy at the core and very poor in quality if allowed to hang on the tree, while the same fruit, picked when firm and hard, but full grown, ripened indoors, will be of an even consistency, juicy and delicious. During the last few days that the fruit hangs on the development of the hard, woody kernels, the so-called stone cells of the pear, proceeds rapidly. Picking before the fruit is ripe seems to partly head off the development of these stone cells, and subsequent ripening processes still further soften and disintegrate them. Among the pears of medium and poorer quality, such as the Duchess, Kieffer etc., the ripening process may almost be said to make the fruit edible, at least make it fit for a dessert fruit. Kieffers allowed to hang on the tree until they are full colored and ready to drop, have the maximum amount of stone cells; in fact the portion surrounding the core becomes almost a mass of woody matter under these circumstances. If, on the other hand, the fruit is picked when it first attains full size, or even a little before, and is ripened in bulk in the dark, it will color up a beautiful delicate yellow, frequently with a red blush, and soften evenly throughout, making a fairly good pear to eat out of the hand and a most excellent canning and cooking fruit. Pears allowed to hang too long on the trees when they are apparently ripe and soft will be found to have merely a shell, about half an inch thick, of ripened pulp and a large central portion either too hard to eat or filled too compactly with stone cells.

**Summer and Winter.**

Generally, pears may be divided into two main classes in regard to ripening methods, namely, summer pears and winter pears. All fruit ripened with or before the Bartlett may, for convenience, be classed as summer fruit, although of course in the southern states autumn varieties of the north, like Seckel and Duchess, really are summer fruits. The summer pears require but a short time, on account of their perishable nature and high temperatures prevailing at picking time, to reach an eating condition after they are picked. It becomes necessary, therefore, in most cases for the grower to pick the fruit and pack it at once into the packages and ship it to market. The fruit will even then arrive none too soon in most cases to suit the wholesale buyer. Summer pears should always reach the wholesale buyer in a perfectly hard, firm condition, or at most just beginning to become soft enough for eating. The retail dealer will, therefore, have time to handle the goods before they spoil. They will surely ripen up on his hands in ample time for him to sell them. The autumn and winter fruit, however, having much firmer texture and requiring longer to soften, should usually be partly ripened before it is started off to market. Pears like the Kieffer color up fully before they are soft enough to eat, and can usually be shipped to the commission houses while full colored, yet perfectly firm and sound.

**Before they Ripen.**

As a general rule, summer and fall pears should be picked from a week to ten days before they would ripen on the tree. The grower determines this point by several kinds of indications. In the first place, the size and appearance are guides to him. As the fruit approaches maturity the dead-green color of the immature fruit is replaced by a clearer, more transparent, and lighter-green appearance, which has to be seen to be fully understood. Again, certain wormy specimens attacked by the codling moth will begin to color up and fall from the trees. These, of course, are a sure indication that the normal pears will ripen shortly. Upon taking hold of the fruit and lifting it gently, if it is approaching maturity and ready to pick, the base of the stem will part rather easily from the twig at the proper separating point. Of course, if the fruit is immature the stem is apt to break at any place, although it may break off at the joint, but the ease with which the stem parts from the twig is a very good indication of maturity.

**Be Careful.**

Pears should always be picked carefully, without bruising, with the stems on. They should be laid carefully in the picking baskets, which should hold a half bushel or so, and then be hauled to the packing house or other convenient place and at once sorted into grades, and either packed and shipped or placed in the ripening house for future shipment.

**Don't Pick All at Once.**

It is usually better in most cases, especially with summer fruit, to pick the trees over two or three times, although this is not absolutely necessary, and unless the trees are heavily loaded may not be worth while. When the fruit has not been properly thinned and the trees are overloaded, many growers begin to pick the fruit long before it is full grown and send it to market. By this means the trees are not only relieved somewhat, but the fruit that is left swells to the largest possible bulk; moreover, satisfactory returns are often secured from the early pickings. This method is particularly successful with Clapp's Favorite and Bartlett. Both of these varieties will ripen up tolerably well when they are not much more than half grown. The same principle is successfully used in handling Le Conte and Kieffer pears, but these should be nearer maturity to be good. There is one great advantage in the application of this principle of premature picking in case of these two great varieties in that it distributes the marketing season over a longer period, and thus tends to give the country time to consume the crop without any glut in the market.

**Cold Storage.**

Pears may be put in cold storage in about the same way as apples, the temperature required varying from 33 degrees to 38 degrees F. They are usually stored at a temperature a few degrees higher than that in which apples are stored, in fact are given the treatment of summer rather than winter fruit. Unfortunately, pears do not stand cold storage as well as apples. This is especially true of summer pears. Extra precautions are necessary in both picking and handling the fruit before it is put in storage, and in the subsequent handling after it is taken out.

**200,000 SOUR ORANGE STOCK**

For 1910 spring planting. Every plant from Genuine Selected Florida Sour Seed, and I can prove it. Also sweet stock. **Don't** buy uncertain and inferior grown plants. This is nursery gospel. **Don't** waste time and money on 6 and 8-in. plants when you can get them twice the size for the same price. **Don't** take my word for it; come and see the plants in seed-bed and nursery. Plants are 9 to 12 inches now, with 9 more months to grow.

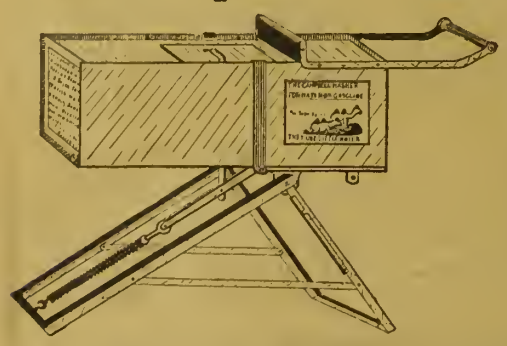
**A Campbell Washing Machine**



will pay for itself in three months. Will wash a blanket or linen handkerchief with equal ease and effect, fancy waists or lace curtains positively safe from injury when washed in this machine. The only machine that can be used for dry cleaning with gasoline. Suits of clothing can be dry cleaned with less than 1 gallon loss of gasoline. Easiest to operate and the most efficient washing machine ever offered to the public. The air and the suds, the slides and the thuds make this washer do easier and better work than any other. A thirty day free trial and guarantee from any imperfection. Made of galvanized iron, will not fall to pieces in hot weather, nor rust.

**FOR WATER OR GASOLINE**

Circular on application. **For Sale by**

**Boesch Lamp Co.**

**1135 Mission St.,** Near the Post Office, **San Francisco, Cal.**

Cold-storage pears are very apt to blacken and become unsightly after they are taken out of storage, even though they may be in fairly good condition. Summer pears, particularly, are inclined to lose their flavor in cold storage Kieffer, Anjou, Bosc, Easter, and some other late varieties when put into cold storage hard and green seem to stand the treatment very well and come out several weeks afterwards in nearly the same condition as that in which they went in. They may then be brought into a warm room for a few days before they are wanted and ripened up nicely for eating.

**Packages.**

The packages used for pears vary widely in different parts of the country. As before mentioned, the half-bushel peach basket is very commonly used in handling the crop for delivery to canneries in Maryland, Delaware, and New Jersey. This basket usually goes under the name of the five-eighths basket. Very few of the models, however, hold five-eighths of a bushel. This basket with a slatted cover is also very largely used in shipping by steamer and otherwise to Baltimore and Philadelphia. It is in some respects the least desirable package of all except in cases where the grower can haul the fruit direct to the city markets or where cars can be filled by packing the entire car tightly with the baskets. The pear box, usually with a middle partition and holding from 3 pecks to a bushel, is very commonly used in the eastern states. Some very rough specimens of this type of package, made of undressed laths with wide spaces between, annually reach the markets of our eastern cities, and, as the package commonly sells the fruit, low prices may always be guaranteed for such a package, regardless of its contents. On the other hand, a pear box on this model made of neatly dressed half-inch pine or similar wood, can be made really a fancy package, and if the fruit is wrapped in paper, and carefully sorted and packed, it may bring the best prices in the market. A still larger package is the pear barrel, a special barrel made for shipping pears, smaller and with less bulge than the apple barrel, and holding about 2¼ bushels. Kieffer pears, and very commonly the southern Le Conte pears, are frequently shipped in the regular apple barrels.

If the grower ships to a commission house, it is wise to consult the commission merchant as to the form of packages which suits the market demands of his city for the different grade and varieties of his fruit. It is very often wise to put up fancy fruit in a fancy and perhaps small package and to put the poorer grades into larger and cheaper packages. Usually nothing is gained by deception in packing the fruit, especially if the grower expects to use the same market repeatedly and to sell to the same cusumers. It is usually best to have a distinct brand or trademark if any considerable quantity is to be sold. If the fruit is really meritorious, grocerymen and other fruit buyers will quickly become familiar with this mark and will come back and call for it again. Fruit which is known by a brand will often sell readily and quickly for 50 per cent. more than other fruit equally as good, but not known to be so by the buyer.—M. B. Waite.

## THE PECAN.

Robt. T. Morris, of New York, says: "I believe, that nut trees are largely to take the place of the useless trees which are at present planted for decorative purposes in public and private grounds.

The reason for this belief is, because there are no more beautiful trees or more attractive than those to be found in the nut bearing group.

Is there, for instance, a more inspiring tree in the world than the pecan, which will grow from New Orleans to Boston, and which rears its head a hundred and fifty feet into the heavens with a corresponding spread, and with the grace of an elm? Is there a more luxuriantly growing tree, almost tropical in appearance, than the heart nut, which will grow as far north as Ontario, Canada? We have in America at least twenty-five kinds of nut-bearing trees that are notable for their beauty as well as for their value."

## APPLE EXPOSITION.

The Denver Auditorium is to be the scene of one of the greatest expositions of the coming season. The Colorado National Apple Exposition will be the grandest demonstration of the apple growing industry that has ever been promoted. Thousands of dollars in prizes will attract hundreds of exhibits in the various classes and it is doubtful if the Auditorium will hold the stuff that is offered for display. The apple industry is growing rapidly and will this year mean millions of dollars to Colorado. No better dates could have been secured than the week from January 3 to 9, 1910.

Not only is it important to know how to raise a good crop of fruit, but it is equally as important to know how to market the crop. Study markets. Keep posted on demands and prices.

THIS GUARANTEE BOND FULLY PROTECTS YOU

LOTS of manufacturers are keen to tell you what their goods are made of. They give you a beautiful word picture of a marvelous and mysterious "gum" that only they can produce. Others tell you of the real "rubber" that they use—and so on.

Regarding Congo Roofing, we have only two statements to make:

**First**—We believe it is the **best** ready roofing made.

**Second**—Because we believe that, we give a **genuine Surety Bond** with every roll, which guarantees three-ply Congo for 10 years.

These bonds are issued by the **National Surety Company**, and they are as good as a government bond.

No other roofing manufacturer **dares** give such a guarantee.

You take no chances when you buy Congo.

There is no "gum" in it to make it sticky; there is no rubber in it to get brittle. It is made of the best roofing materials that it is possible for us to purchase under the best manufacturing conditions. Because it is made right, it gives such satisfactory service that we are not afraid to issue a **Guarantee Bond** to back up every statement we make.

Ask any other manufacturer for a **Real Bond** and see him squirm.

**Booklet and samples of Congo free on request.**

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## UP TO DATE.

(By Mrs. M. E. Sberman.)

WHILE philanthropists claim the child has an inalienable right to be born in healthy surroundings and from healthy parents, at present the calf is securing this right as a money saving principle. The sanitation of the modern barn is better than that found in many flats. In the better class of stables, the builder carefully measures the air space and arranges for tbe fresh air to be admitted without any drafts striking Madame the cow. The King system as applied to barns is nearly perfect in its work of furnishing a constant supply of pure air. The mangers are kept scrubbed clean and all the surroundings of the cow make for health. This is while the cow is giving a liberal supply of milk, but, by and by, the cow goes dry and then she is turned out of the herd and left to feed on the scanty grasses until she freshens again. When the calf is dropped it is illy nourished and weak. Wben the cows go dry, a little grain should be fed if they are thin and they should be provided with a dry shelter from the chilling winds to sleep under, and good alfalfa hay to eat, with abundance of fresh water to drink. Rest, quiet, and enough to eat, are their needs, all served to them in a way that will not tax their strength. The watering trough should not be half a mile away from the hay rack. This is the way it should be, while the usual way is to turn the dry cow out with the heifer stock to rustle her living in a pasture without shelter from the heat or cold. Lest, this seem an exaggeration, I refer you to the story on record of a careful breeder whose cow completed a wonderful year's test of butter fat. She had been coddled and fed, but as soon as her test was made, out she went into the cold and died with pneumonia almost before her record was cold in print.

Tbe heifers that are springing should be put in with the dry cows and fed on abundant food of a light laxative nature, silage, green grass, roots, bran, and plenty of good alfalfa hay. Pet and talk to the heifers and they will come in gentle to the milking string. There will be no breaking to be done as they will be ready to adopt the milker as an older son in their newly aquired motherliness. By having the stock come in to the milk string in good flesh, the calves dropped will have a vigorous start in life. The extra feed that has been given the cow comes back in the milk pail, almost all of it. The difference between a well fed cow in milking and one that is weak and poor is greater than anyone realizes that has not provided liberally for the dry stock.

**Sires.**

The selection of the sire is not taken up here except in passing to say that he should be strong and vigorous. A starved sire will not get as good calves as one that is fitted by good feeding. The prevailing idea of using youngsters to head the herd is not a good one. Mature sires and dams are the best. Hold on to the old sire as long as possible if his calves are good. Increase the uniformity of the herd by having many full sisters among the cows. The old sire should be kept until he dies if possible at the head of the herd. If he is used with care and fed enough of the milk making feeds along with the cows, he will not grow over fat and become unwieldy. When there are twelve cows in the herd, that have been bred for six years to the same sire, it would give seventy-two calves, counting all lived. Out of this, say thirty were heifers, these cows would be a uniform lot and a young sire carefully selected to head the second lot would come in use after they were grown up. Tbe heifers from the original herd would be added to his string until a third sire was needed .Now if for any reason the older sire is discarded, it is better to buy a mature animal for the head of the herd, unless tbe second sire's string is small enough to absorb the older cows into his band. By a little sea-sawing two sires may be enough for a good number of cows, though it will bring back sometimes, a few of the grand daughthers to be bred to the grand sire. This will increase all the qualities, the good, as well as the bad. Beware, therefore, of physical peculiarities that may be intensified. It is hard to express just how much fat a cow may carry, when she comes into the milking string. She must be in relaxed condition at calving time and this is easiest to produce by feeding ensilage with good alfalfa hay in quantity. If there is no silo (would you believe it there are actually dairymen that do without silos? Not of, course, in a progressive state like California) then roots and bran should be freely fed to the dry cows right up to the time when they freshen.—M. E. Sherman.

## FOURTH BUTTER CONTEST.

There were twenty-one entries to the fourth educational butter scoring contest held at tbe University Farm, and the highest score was 95 taken by the Pioneer Creamery at Ferndale, Humboldt County. Unfortunately, very few entries have ever come from Humboldt County; hence her tardy recognition. We are glad to report a continued interest in the educational effect of the scoring contest in California, as is shown by number of entries received this time. Probably August is the most discouraging month here for buttermakers, and doubtless many sent butter knowing that circumstances were greatly against them. In general, the quality of the June entries was maintained. All packages arrived in good condition and were held in cold storage several days in order to insure uniformity in that regard. The judging was done by Mr. C. L. Mitchel, federal inspector for the Coast; Mr. L. M. Davis, recently from Kansas and now with the College of Agriculture; and the undersigned. The scores are as follows:

The good effects of using starter for which we have been contending the past few months begin to be apparent. All of the first ten on the list used starter which includes all scores of 93 or above. No one failing to employ a starter received a score of more than 92½. We note with interest that those who have previously scored low on butter made without the use of starter have in this contest advanced well toward the top of the list by using a starter. At least they report having used starter and we feel safe in attributing the improvement directly or indirectly to the starter. Of course a starter will not accomplish the impossible, but the results obtained by its use at this contest by those who have not employed it before, should be encouraging and significant to all buttermakers. We urge all managers and creamery operators to supply their buttermakers with starter cans if they have not already done so. The amount of starter used varied from 10 per cent to 40 per cent. One creamery, where the buttermaker previously complained of being unable to secure milk for cultivating a starter, now reports the use of 10 per cent in making his entry

All entries were made from gathered cream with the exception of two or three that report a very small amount of whole milk, but too little to be of any significance. The first and third entries were made from pasteurized cream, using temperatures of 160 degrees and 176 degrees respectively. It seems proper to warn the buttermakers against using too high temperatures for churning and washing. Those who were most successful in this contest cooled to 50 degrees or lower, churned at 55 degrees to 57 degrees and used wash water at not over 60 degrees. Others averaged 5 degrees higher than this and apparently to their disadvantage. Doubtless, there is a temptation to raise the temperature in order to incorporate water but at the same time body is injured, as was observed in several entries. Moisture tests of all entries have not yet been made, but so far they seem to average low. Individual letters of criticism and the score cards will go forth as soon as possible.—Herbert A. Hopper.

## HOW TUBERCULOSIS SPREADS.

Common sense, vigilance and education are the three essentials for the protection of our cattle from so-called "contagious diseases" and for the producing of dairy products free from disease-producing bacteria.

The fact that there is a great deal of tuberculosis in many of the barns most elaborately equipped for the carrying out of sanitary principles leads me to think (and I think that you will agree with me) that under prevailing methods—which, carried out to the letter, in many barns result only in the slaughter of entire herds—even though the "cows be of gold and the barns nickel-plated," they will still have tuberculosis.

Evidently there is a terrible leak in our sanitary arrangements, or rather a vacuum which has never been filled. One good exampic of the inefficacious methods—and there are thousands to exemplify it—is found in the barn of a breeder who recently received a first prize for the best-kept farm in Massachusetts. Soon after the bestowal of this most elevating recognition, his entire herd, with the exception of two head, was stricken with tuberculosis, a result, as he thought or as he was made to think by bacteriologists, of buying a tuberculous cow.

But is this practical or consistent with nature? I know that it has been the undivided opinion for many years. Doesn't it seem a little fabulous? Are the level-headed dairymen going to believe that one tuberculous cow brought into one of these so-called perfectly sanitary barns, full of smooth-coated and healthy cows, will infect the entire herd, unaided by any other agent or element?

Far be it from me to believe an occurrence such as that in the barn above mentioned and in many other barns throughout the states was ever ordained by the Almighty, otherwise than as a means by which to designate the utter unfruitfulness of attempting to "stamp out" a disease without beginning at the root and staying there until the disease is starved out of existence.

The farmer when he kills his tuberculous cows is aptly compared to the father who whipped his boy because he complained of the stomach-ache. But the father has by far the best ground for his action, as in all probability, he whipped his boy because he ate green apples. When the farmer kills his tuberculous cows he does it because he is told to, and in 99 cases out of a hundred he is not told the cause of the disease and does not know himself. Provided he is told, it is by a veterinarian who knows but little of the causes of tuberculosis in general, let alone the cause of an individual case.

Who is to blame if tuberculosis spreads through a dairyman's herd? The dairyman, every time. A perfectly healthy cow, in her own barn and in her own stall, will not—under conditions which prevail in our best stables as well as in our poorest—create tuberculosis in her own body. I do not wish any one to think I insinuate that the disease is not contagious—that is out of the question. But what I do wish to convey is this—that a healthy, rugged cow will not be contaminated by the tuberculosis if she is taken care of as she should be.

Veterinarians and bacteriologists may argue from now until doomsday. They cannot give a healthy cow tuberculosis unless they inject the tubercle bacilli directly into the animal's system. When each and every farmer is taught or finds out for himself that it is he, and not the Almighty, who is responsible for the existence of the most dreaded of all diseases, then, and not until then, will tuberculosis (bovine) be starved from our herds.—Jersey Bulletin.

---

Some idea of the importance of milk as human food may be gained from the fact that about one-sixth of the total food of the average family is furnished by it and its products.

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

## NATIONAL DAIRY SHOW.

The next National Dairy Show, will be held in Milwaukee October 14th to 24th. The inquiries for space for the display of machinery and dairy cattle indicate a wide interest, and reports coming in suggest a goodly attendance of those interested in the various phases of the industry.

---

As to the amount of pasturage or the number of hogs alfalfa will carry per acre without injury to the crop, the estimates given by farmers vary considerably, depending on the kind of soil, the fertility of the land, and the size of the hogs pastured. The following, however, is a safe estimate as given by conservative men who have had much experience. River valley and creek bottom land well set in alfalfa will carry from 15 to 20 head per acre of 50 to 125-pound hogs. Upland of fair average fertility will support from eight to ten head of the same kind of hogs. There are fields that have supported 25 head per acre through the season for a number of years and are still in good condition, and there are other fields that will not furnish pasture for more than five head per acre; but these are extremes. When a field is only used for pasture it is better to divide it into several lots and move the hogs from one to the other as occasion requires.—From Coburn's "Swine in America."

---

Our farmers are throwing away good opportunities of making good profits from their home-grown foods by not feeding a few lambs.

This can easily be seen from a practical and scientific point of view. Some may argue that the farmers should grow their own feeders, and in that manner make the whole profits, but to these men I would say that such a practice would be opposed to the science of the business of feeding lambs for mutton.—Lexington Herald.

---

Good, unadulterated milk should contain about 87 per cent of water and 13 per cent. solids.

**40 Legs** Imagine a man with 40 legs, 40 feet to wash, 40 shoes to repair, and yet unable to travel as fast or as far as a two-legged man. Wouldn't have much excuse for those bothersome, extra 38 legs, would he?

Same way, exactly, with cream separators. Common disk, or "bucket bowl" machines are full of parts Some have 40 to 60 disks inside

Yet they can't skim as fast or as clean, can't run as lightly, can't be washed as quickly, can't wear as long as the simple, sanitary Sharples Dairy Tubular that has nothing inside but the single little piece on the thumb. No excuse for disks. Get a Tubular with the can that never moves. World's biggest separator factory. Branch factories in Canada and Germany Sales exceed most, if not all, others combined. Write for catalog No. 260.

# Small Fruits and Vegetables

### THIS MONTH.

IF CHRISTMAS vegetables are wished, it is none too soon to begin the work. Plow or spade in the manure and irrigate thoroughly to fit the ground for the seed.

Yorkshire Hero peas are probably the best pea. Wax beans may also be planted, as may cabbage, cauliflower, celery and onion sets. Rhubarb may also be replanted profitably at this time.

Naturally the human race turns to gardening in the springtime, but the Californian who appreciates crisp vegetables will have great pleasure in making garden at this season.

### USING POISON IN THE GARDEN.

Some of my friends and neighbors frequently ask me about using poisons on their various garden crops, even on strawberries for leaf roller or other leaf eaters. Paris green is still much used; but occasionally an inquirer wants to know something about arsenate of lead and how to use and combine it. I always advise them to quit talking and inquiring about Paris green and give up using it entirely. It can in no way compare with arsenate of lead. It is not so safe to handle, not so safe to apply and not half so effective. Arsenate of lead is in paste form. We run no risk of having to breathe the poisonous dust as we do when handling Paris green. We can apply it any strength required to kill the biting insects without running any risk of injuring the tenderest foliage. In short, we now use arsenate of lead and nothing else except perhaps white hellebore for the currant worm. Arsenate of lead sticks to the foliage or fruit to which it is applied. It might stick long enough on the currant fruit to make its use risky, and white hellebore does the business. But it does not help us in fighting potato beetle, flea beetle, cucumber beetle and especially the rose chafer, also codling worm, etc. We can kill any of these easily with arsenate of lead, and all that is needed is to use it in proper strength. For ordinary use I put about three pounds of the paste in 50 gallons of spray mixture. For the "rose bug" even more may be required. Since using arsenate of lead, as I have done for the past six or eight years, I have had no difficulty in conquering potato bugs, flea beetles, cucumber beetles, etc. By spraying with arsenate of lead either in combination with Bordeaux mixture or the commercial lime-sulphur solution, I have not failed once to save my potato, cucumber, melon and squash vines from serious injury by their insect enemies, and I shall continue to use arsenate of lead until something better is brought out. But the question comes: "Where do you get it?" The drug stores don't keep it. Grocers keep Paris green, perhaps hellebore or even London purple; but they know nothing of arsenate of lead. This poison is not in the general trade. It is emphatically a compound prepared almost exclusively for agricultural uses. Up-to-date seed and supply stores keep it in stock. I can get it in seed stores, for instance; and the seedsman who does not offer it to his customers does not keep a complete assortment and stock. Of course, you can easily prepare your own from drugs which you will find at your druggist's—arsenate of soda (4 ounces) and acetate of lead, or "sugar of lead" (11 ounces). Dissolve in water, and the arsenate of lead resulting from the combination will settle at the bottom as a white paste. It can be bought quite cheaply, however, (12 to 15 cents per pound) if bought in larger quantities from agricultural supply dealers, but will cost more if bought in small quantities, or if homemade from drugs bought from the retail druggist. Pains must be taken to properly dissolve this paste before it is mixed with the spray liquid. Take small quantities and add a little water or Bordeaux mixture; then stir it thoroughly like lead paint until the paste is reduced to a cream or milk-like consistency. Then it may be poured into the spray liquid and sprayed. It is not liable to settle to the bottom again, after once being dissolved, as Paris green will do.—T. Griner in Southern Cultivator.

### THE GARDEN COMPOST HEAP

In numerous instances plant diseases are spread from the garden compost heap on account of the gardener throwing old and diseased plants into the compost heap to make manure for next year's use.

The experiment stations have discovered that corn smut, potato scab and cabbage club root are many times caused from compost heaps. Some gardeners will burn all affected plants rather than utilize them for manure and have them become mixed with their soil. They believe that such a practice of putting them in a heap will result in the multiplication of diseases and also insect pests.

As a general rule it is not best to spread refuse of one crop on land designated for the same crop, whether in the garden or field. Onion refuse should never be spread on land that is calculated for onions, on account of the danger of propagating the smut. Cabbage refuse should not be spread on cabbage land on account of the danger of propagating club root and black rot. Burn it and destroy its power to propagate disease in your gardens, and on your farms, or else put it on a field where some other crop is to be grown.—Agricultural Epitomist.

### SCABBY POTATOES.

Potato scab is a disease of the potato tuber caused by a funguous growth attacking them in the soil. Spores of the fungus will remain in the soil from year to year and on the tubers from one season to another. The disease causes the surface of the potato to become rough and unsightly and very often extends deep into the flesh, injuring its food value.

Scab on potatoes can be prevented by planting uninfected tubers in clean soil, and the danger of infection may be reduced by rotation, or by planting the potatoes in different soil each season.

Dissolve two ounces of the corrosive sublimate in 2 gal. of hot water. When it has dissolved, mix it with fourteen gallons of water and sprinkle or pour it over the potatoes, so that all of the tubers become moist with the solution. What is left over of the poison must be carefully disposed of.—Journal of Agriculture.

# Eucalyptus Seeds

In large or small quantities, 33 kinds to select from. Write for free pamphlet "Eucalyptus Culture." It gives full directions for sowing the seed, raising the plants and planting out into the field, together with descriptions of all the leading species, giving their uses and the localities to which they are adapted. Sample packcts 15o each, 2 for 25c, 4 for 5oc, 9 for $1.00. Choice Flower, Garden, Tree and Palm Seeds, Roses, Flowering Plants etc. Catalogue mailed free upon applioation.

# The Ornamental Garden

### THIS MONTH.

THIS IS a busy season in the flower garden. Winter and early spring bloomers require thought at this season. Sow pansies, stocks, cosmos, coreopis, centaurea, cineraria and especially sweet peas. Earlier sown pansies and stocks may be replanted.

Roses which have been resting may now be pruned back and irrigated and manured heavily for winter bloom.

This is the proper month in which to sow acacia, Eucalyptus, pine and cypress seed.

A beginning may be made in the planting of the hardy Dutch bulbs.

### PLANTING AND CARE OF ROSES.

In order that roses may be employed most effectively they should be planted in beds and masses, from 20 to 100 or more plants together and all of one kind, not a variety or mixture. When planted in beds, roses should be set about 18 inches apart, or 13 plants for a bed six feet in diameter and 37 plants for one 10 feet in diameter. The hybrid perpetuals may be planted two feet apart, or about seven plants for a bed of six feet in diameter, or 19 plants for a bed 10 feet in diameter.

The rose bug or chafer must be hand-picked and destroyed and the leaf roller crushed. I do not know of any effective remedies for either. Disease should be warded off by keeping the plants in a vigorous, thrifty condition. When planting, cut back the shoots to three or four eyes.

Roses to be seen at their best should be examined in the early morning, while the dew is yet upon the blooms and before the hot sun has caused them to lose color. For the same reason, roses intended for house decoration should be cut early in the day and care should be taken to cut specimens in the bud state or partly open—as they keep best and are seen to the best advantage.

No one can afford to omit this charming flower from the garden. The care bestowed on it and the trouble taken with it will be repaid a thousand times and the pleasure derived from rose culture should not be limited to the few but open to all.

I will close with Dean Hole's advice to rose growers:

"He who would have beautiful roses in his garden, must have beautiful roses in his heart. He must love them well and always. To win he must woo, as Jacob wooed Laban's daughter, though drouth and frost consume. He must have not only the glowing admiration, the enthusiasm and the passion, but the tenderness, the thoughtfulness, the reverence, the watchfulness of love."—William C. Barry.

### THE PEONY.

We have often called the attention of our readers to the peony because we believe it is one of the most desirable flowering plants for the farmer's home grounds. The bloom is almost, or quite, equal to the rose in its beauty, while the plant is much more hardy for the lawn. In fact, the peony is so hardy and determined in its habits of growth that the planting of strong roots in a fertile soil is about all that is required to secure bushels of flowers for the home.

The peony has received much attention in recent years from specialists who have developed many new colorings and patterns in the blossoms. A visit to the grounds of a peony specialist will excite the admiration of any lover of flowers, as he notes the delicate shades of colors and beautiful rose-like shape of the bloom. Several additions are made to the list of named varieties every year.

The peony does its best in a rich, moist soil that is well drained. A mulch of well composted stable manure should be applied for fertility which will stimulate growth and develop large, well formed blossoms. The peony makes attractive borders for driveways, also for division lines between the lawn and garden.

### CARNATION LEAF SPOT.

The use of too much water helps to bring on carnation leaf spot. When a plant is so affected remove all the badly affected leaves and wash the plant with the dilute Bordeaux mixture. Perhaps it would be better to dust it with the dust instead of using the liquid mixture. The dust is made by dissolving one and a half pounds of sulphate of copper in a gallon of boiling water. Then take a peck of lime and dry slack it with the liquid, to which you can add enough water to properly dry slack the lime. When the lime is reduced to a powder, dust the plants twice a week with the dust, If you have only a plant or two, it is sometimes advisable to cut the spots with a small pair of shears before you apply the dust. The soil should be kept reasonably moist, but not too wet. There should be a reasonable amount of sunlight, but the room should not be kept too hot.

### CEMENT WALKS.

If a good well-balanced mixture is used when building concrete walks they are more serviceable than quarried stone. The largest stone used in the concrete should not be over two inches in diameter. The gravel should be of all sizes with enough sand added that the necessary amount of cement used will fill the gravel. If too much sand is used, the walks will be weak and chalky. If too much coarse gravel is used the sand and cement will not fill the material and bind it together. Many contractors make a practice of leaving the foundation convex, and build the walk thin in the center to save material. Walks that are thin in the center are very apt to break as there is much more strain on the center of a walk than there is on the outside.

When the foundation underneath a walk is low at the center the weight of travel being near the center it is apt to check sooner or later. If the foundation is too high in the center the whole weight of the walk rests on a small bearing and the risk of breaking is much greater than with a proper foundation. When the walk is only three inches thick at the center it will last but a short time unless the foundation remains perfect. It costs but very little more to build a walk five inches thick in the center and it is worth twice as much for any purpose as one three inches thick.—Successful Farming.

### FLOWERS IN HONOLULU.

We have so long been considered a land of flowers that we cannot help but be surprised at the following clipped from the Hawaiian Planters Monthly:

The flower business of the Islands is largely in the hands of Hawaiians and Japanese. Carnations, violets and asters flower almost continuously, especially at elevations above 1,000 feet. The Honolulu market is well supplied with flowers, such as they are, but a number of florists find it profitable to bring considerable quantities of the finer classes of cut flowers in cold storage from San Francisco. The opportunity is open in the production of finer types and strains of cut flowers, ferns, greenhouse plants and ornamentals, as in the case of vegetables of improved types.

EUCALYPTUS

Rostrata and Tereticornis Only

This company offers 1,500,000 seedlings of the above varieties for sale for FALL PLANTING. We have 5,000,000 seedlings in our large nursery at Tulare, California, the major portion of which are grown for our own use.

The authorities are rapidly coming to the opinion that the Fall planting is the best and we venture the belief that in a short time Spring planting will have become a thing of the past.

Our trees are grown by Prof. D. C. Burson, a noted forester of forty years' experience, which insures the best possible product. Seedlings are inured to all weather conditions and are strong and vigorous trees 10 to 12 inches in height.

WE INVITE THE CLOSEST INSPECTION.

Orders only received subject to prior sale.

## Contents

PUMPING FROM DEEP WELLS, Cover.

EUCALYPTUS VALUABLE FOR ORNAMENTAL PURPOSES, 219.

CITRUS AND SUB-TROPICAL FRUITS.—Mango in Hawaii; Artesian Flows Conserve Moisture; Florida Orange Crop; Forest Reserves in the U. S., 220, 221.

DECIDUOUS FRUIT CULTURE.—Picking and Marketing Pears; Apple Exposition; The Pecan, 222, 223.

LIVE STOCK AND DAIRY.—Up-to-date; Fourth Butter Contest; How Tuberculosis Spreads; National Dairy Show, 224, 225.

SMALL FRUITS AND VEGETABLES.—This Month; Using Poison in the Garden; The Garden Compost; Scabby Potatoes, 226.

ORNAMENTAL GARDEN.—This Month; Planting and Care of Roses; The Peony; Carnation Leaf Spot; Cement Walks; Flowers in Honolulu, 227.

EDITORIAL.—New Dress; Peru Waking Up; Green Manure Crop; Lemon Men's Club; Fair Attractions; Ornamental Eucalyptus; Board of Examiners; State Fruit Growers Convention, 228.

AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast, 229.

IRRIGATION AND FORESTRY.—The Pinchot-Ballinger Controversy; Our Timber Supply, 232.

PROFIT IN THE POULTRY YARD.—Get Ready to Show; Feeding Trough; Ticks; Value of Land Plaster, 230, 231.

GENERAL AGRICULTURE.—Nurse Crop Not Best for Alfalfa; Plant Breeding, 233.

QUERIES AND REPLIES.—Queries; Fleas; Eucalyptus for Moist Land; Green Aphis; Grape Juice; Sequoia Gigantea; Belgian Hares; Gum on Fruit; Gypsum, 234, 235.

HOUSEHOLD DEPARTMENT.—I Cannot Sing the Old Songs; Robinson's Detective Work; Home Laundry; Recipes; Fireless Cooker, 236, 237.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 238, 239.

## New Dress.

IT IS CHARACTERISTIC of all of us that when we don a new dress or bonnet we feel just a bit elated and so conduct ourselves, sometimes unconsciously, as to call our friends' attention to the fact. The modesty of the Cultivator is not quite so prominent but that it may in so many words ask, "What do you think of our first page and the head lines of the departments in this week's issue?" We have retained the general outline of the letters used in the former head, for we feel that that is a part of ourselves, but have substituted the outline for the black letter, and have otherwise made sufficient change so that you will notice that we have something new. We trust that, as is usually the case with the wearer of new clothes, we may be inspired to still better behavior and to more fully meet the expectations of our ever increasing family of readers.

## Peru Waking Up.

THE CULTIVATOR is in receipt of a communication from the Consul General of Peru in New York in regard to agriculture in Peru, enclosing an article in which the possibilities of fruit growing and agriculture in general are touched upon in a scientific as well as a most attractive way. The letter calls attention to the fact that upon the completion of the Panama Canal in 1915, the country south of the equator will have great opportunities for putting winter fruit into New York and the Eastern Coast points in wonderfully short time, and compares the advantages of Peru over California in supplying that trade. The article says:

"The climate of Peru is so well adapted to the growing of grapes, pears, strawberries, raspberries, blackberries, peaches, paltas and other fruits and all the vegetables which are consumed by the people of the United States in large quantities. In the tropical countries these fruits and vegetables of the temperate zone do not grow to perfection, if at all, so that competition from that source is impossible. The supply of citrus fruits and apples, the latter having the quality of remaining in perfect state of preservation for many months after harvesting, is now ample and Peru can never expect to compete with California in citrus fruits and with many other parts of the world in apple culture."

Now we do not think that this offers any particuar menace to California's position as a fruit producer, but it should give added incentive to produce only the best which our soil and climate are capable of producing. Too many of our growers fall back on the claim that "California Fruit" are words to juggle with and the simple fact that fruits are grown in California is sufficient. But more and more it is being proven to us that only the highest grade fruit can be marketed with profit. We have looked upon the Panama Canal as all our own, and indeed it will be a great advantage to the entire Pacific Coast by furnishing an outlet for our products. But let us not close our eyes to the fact that there will be others looking to the same outlet. This should spur us on to meet the competition with a quality of fruit which others cannot equal.

## Green Manure Crops.

NEXT WEEK'S ISSUE of the Cultivator will be given up almost entirely to an article on green manure crops, or rather to a symposium of articles provided by subscribers to the Cultivator in various parts of the state.

Of course cover crops have been a factor of agriculture from time immemorial, but the practical and more general use is of comparatively recent origin. It began in the orange groves of Southern California and has now extended to vineyards and orchards in all sections of the state, and we believe the effort to gather together the fund of information which will be published next week, will be appreciated by the readers of the Cultivator.

Unfortunately the low price prevailing in the past for vetch seed has been ended, either by a combination of the large handlers of the seed, or possibly by shortage, as the dealers claim, and it will cost the farmer nearly twice as much as it did last year. But regardless of the price of seed, the use of the cover crop has come to stay, for as some of our contributors will say next week, the saving in cultivation of the orchards through the winter is sufficient to cover cost of seed and seeding. And that saving is of small account compared to the saving from soil erosion in times of storm, to the addition of humus to the soil, the increase of nitrogen, and the making available of other soil elements.

A half dozen illustrations of various legumes and of the nodules on the roots will be used in this number. This will be an issue worth waiting for, and we give out these hints that our subscribers may be planning for their green manure crops, for it is none too early to shape the land for the seed. The next few weeks should see all the seed in the ground.

## Lemon Men's Club.

ONE OF THE LIVE and up-to-date horticultural clubs of the state is the Lemon Men's Club of Southern California. It has been a factor in advancing the interests of its members. It has held many meetings at which cultural and other subjects have been discussed, but believing that "He that maketh good use of any part of his life, must allow a large proportion of it to recreation," the members of the club will spend one day, September 11th at San Fernando. Part of the day will be spent in visiting the olive and lemon orchards of the valley and the Old Mission, and at noon time luncheon will be served to members at the ranch of Mr. C. D. Hubbard. After luncheon a business session will be held and an address delivered by Mr. J. A. Reid who has spent the summer amongst the orange groves of Florida.

## Fair Attractions.

WE HAVE RECEIVED a copy of the premium list of the Minnesota State Fair which announces that there will be many "spectacular productions, expensive and sensational." Among the features of the program are: Hilda Caroli, The Australian Ballet, The Sisters Brazelly, The Carmen Troupe, The Fat Navarro Troupe, Rex's Comedy Circus, The Up-Side Down Zeraldas, Mlle Omega (who by the way possesses "daring beauty"), and Luken's Trained Lions—and this is not a third of the attractions offered—and each day's program is to be ended with a dazzling display of Gregory's Fireworks—all of which is exceedingly agricultural, almost equal, by the way, to the great bar-maid attaction of California's State Fair. Later in the premium list are announced premiums for genuine agricultural products. It is possible they are not secondary to the "attractions" on the program, but it would look so to an outsider.

By the way that bar-maid feature is serving to give our state fair a wonderful lot of free advertising. To many of us it may be a class of advertising which is not relished, but it is at least making known the fact that we have a state fair and that one of its features is the adoption of a custom of European countries in having young women to serve wines to those who may wish to purchase. The opinions so far expressed have been rather scathing, and we presume the administration has heard before this from many sections that this is one European custom which will not be received with open arms in this state.

## Ornamental Eucalypts.

THE FIRST PAGE article this week written by Mr. Coates of Morganhill, calls attention to the eucalyptus as a tree possessing great beauty. We have often heard the expression that a street has been planted "only" to eucalyptus, but the more observant have seen great beauty in these trees, especially in the more arnamental varieties. Mr. Coates gives a list of the most desirable and from it some of the most beautiful avenue trees may be selected. In fact our old staid and tried friend the blue gum is very beautiful for roadside planting when kept in proper form. It is such a rapid grower that much work is necessary to keep it in shape. We admit that it is not a very clean tree, owing to the shedding of bark and dropping of leaves, but this last objection applies to practically any tree which may be planted.

## Board of Examiners.

THE BOARD appointed by Governor Pardee to examine as to qualifications of horticultural commissioners of the various counties, has finally got into working shape. The board is now made up of A. T. Garey of Los Angeles, E. K. Carnes of Sacramento, and Mr. Collier of Corona. The organization was perfected in Los Angeles last week by the election of Mr. Garey as President. Work will begin at once, questions will be outlined, and a little later, dates will be announced for examination of applicants in the different counties.

## State Fruit Growers Convention.

WE NOTE the announcement that the state fruit growers will convene on the 6th of December in Watsonville. Appeal has been made by local fruit growers of Watsonville to their Board of Trade and others, to rise to the occasion and give a rousing welcome to delegates who will visit the city from all parts of the state. We imagine that this year's session of the convention will be an important one. There are many new questions of interest before the fruit growers and some of the old ones which have been before former conventions are still unsettled.

# Agricultural News Notes of the Pacific Coast

## Northern California

Crushing wine grapes will begin in a few days.

Hop picking is in full swing over the Sacramento Valley.

The drying of prunes is in full swing in Sutter county.

Meridian, Sutter county, is soon to have an alfalfa meal mill.

Over 100,000 acres will be reclaimed in the Sutter Basin.

Yuba City is sending out about 500 tons of Thompson Seedless grapes.

Chico, Butte county, reports exceptionally heavy crop of almonds.

Ground squirrels are doing great damage to the orchards of Yuba county.

A Yuba City grape grower has received $25 per ton for his Thompson Seedless.

The Sonoma county Pomona grange held its last regular meeting at Two Rock.

Great damage was done by codling moth in the pear orchards of Mendocino county.

Extensions of telephone service will be made to many farm sections of Solano county.

An explosion caused by gas occurred in the Marysville Cannery, doing considerable damage.

Prof. M. E. Jaffa will conduct a number of feeding experiments at the Petaluma state poultry farm.

Large receipts of Muir peaches at Vina drying yards are taxing the yards to their fullest capacity.

The demand for help to gather the fruit of orchards in Gridley, Butte county is far in excess of the supply.

The Diamond Match Co. is planning to save the by-products from its large mills, in the form of paper pulp.

Those in charge of the plant introduction garden at Chico contemplate a series of experiments in bybridizing.

The southern part of Humboldt county is showing a rather lighter hay crop than usual, but it is of exceptional quality.

One large land owner at Yreka, Siskiyou county, has filed on 12,000 inches of various streams to secure water for irrigation.

Willows, Glenn county, has been experimenting with tobacco production and has some exceptionally fine samples of the weed.

The board of equalization has found that suburban land in San Mateo county which is held at $4000 an acre has been assessed as wheat at a nominal figure.

The State Farm at Davis has a herd of young stock inoculated something over a year ago with the germs of tuberculosis. This was for the purpose of scientific observation.

A meeting of farmers of a part of the Sacramento Valley was held at Rio Vista for the purpose of considering the plan by which the state and government engineers should deepen and straighten the channel of the river.

## Central California

Capitola will hold farmers institute September 10 and 11.

San Jose has 150 people employed in the apricot pit cracker.

Poplar, Tulare county, is proving to be a good melon section.

The Turlock Journal says that this year's Elberta peaches are the finest ever.

Last week was the banner week in Fresno county for green fruit shipments.

A Kingsburg man has invented and patented a machine for cutting peaches.

Delano, Kern county, is making an appeal for a creamery and has fair promise of one.

A Salinas Valley threshing machine claims the record of 259,950 pounds of barley in a single day.

Pajaro Valley will ship 500 tons of dried apricots for which it is hoped to secure $80,000 or $90,000.

The farmers union of Fresno county has opened two new shipping points within the last week.

Raisins are now commanding two cents per pound, and a few have been found willing to sell at that price.

One party has filed on 30,000 inches of water of the San Benito near where it empties into the Pajaro River.

A force of men is at work on the grounds of Tulare County Agricultural Fair which will be held September 13-18.

Hundreds of carloads of watermelons, cantaloupes, peaches and grapes have been shipped from Turlock in the past few days.

Turlock fruit growers are making a vigorous kick because San Francisco shippers are shipping their fruit without Turlock label.

The big hay warehouses at Tres Pinos and Hollister are filled with hay. It is estimated that by the end of the season 1500 tons of hay will be stored.

Seven hundred and fifty tons of kernel meats of apricot pits are shipped to Germany every year from California.

Monterey county Chamber of Commerce will prepare and maintain an exhibit in the State Board of Trade at San Francisco.

The Pajaro Valley apple growers will make an exhibit of apples this fall at the National Apple Show to be held in Spokane November 15 to 20.

The San Joaquin county table grape growers have decided to build and equip four packing sheds at Lodi, Woodbridge, Norton, and Eight Mile Road.

A Redlands man promises to establish a $100,000 olive factory in Fresno, providing sufficient fruit can be assured him and proper inducements are made.

Arrangements have been completed for the construction of a large reservoir as auxiliary to the canal system of Modesto. The reservoir is 30 miles in circumference and 25 feet deep.

## Southern California

Corona is shipping honey to Trinidad, Colorado.

One ranch in the Anteiope Valley is now fattening 700 steers.

Orange county has launched with much enthusiasm a good roads campaign.

Some of the date palm trees in Coachella Valley are loaded with fruit.

In a little over a month cotton pickers will begin work in the Imperial Valley.

A company has purchased and will install a cotton gin at El Centro, Imperial county.

All indications are that this is going to be a good celery year for Orange county.

The drier, warmer weather has been injurious to the bean fields of Ventura county.

The horticultural commissioners of Imperial Co. have begun a war of extermination on dodder.

Over 3000 Indians gathered in honor of the 105th anniversary of the Pala Mission in San Diego county.

The Rialto Orange Company paid to its members $1.50 per hundred pounds for all navels delivered.

A rumored strike at the Santa Ana sugar factory showed a loss of only eleven men out of two hundred.

Stock men have found the forest reserves in Southern California show much better grazing than ever before.

Grape growers at Brawley are finding much difficulty in getting satisfactory returns from commission men.

Coachella Valley farmers are becoming concerned as to the possibilities of Johnson grass proving hard to eradicate.

The Dairymen's branch of the farmers union held a session in Imperial last week and elected permanent officers.

Enough local farmers unions have been organized in the Imperial Valley so that a county union is now contemplated.

Southern California Sugar Company at Santa Ana held its annual meeting last week, and re-elected same directors.

Orange growers are concerned over the high price and scarcity of vetch seed this year. Prices are nearly double those of last year.

The Southern California Pathological Laboratory is continuing its studies in celery blight of the Orange county celery fields.

Imperial Valley is not content with its transportation facilities and has organized a transportation company which will handle freight by autos.

Examination will be held at various Southern California points on October 25th and 26th touching upon qualifications of applicants for positions in forest service.

The output of sweet potatoes from Orange county will be much shorter than usual. It is estimated now it will not exceed 11,000 sacks as against 25,000 last year.

## The Coast

Watermelons in Seattle are selling at $30 a ton.

Prune growers at Freewater, Wash., are receiving $32 and $33 per ton.

Farmington, Wash., farmers report 50 to 60 bushels per acre from their wheat.

Orchardists of Eastern Oregon are crowding many of the cattle men off the earth.

Salem, Ore., reports a heavy rain storm which did great good to the hop yards.

Colorado will ship this year in excess of 3500 cars of apples as against 1700 last year.

Umatilla county, Oregon, reports the biggest yield of wheat and the best prices ever.

The owner of a 40-acre apple orchard at Sunnyside, Wash., nets $8,500 for this year's crop.

A Wenatchee, Washington, apple grower has just sold his twenty acres of apple orchard for $23,500.

Arizona watermelon growers have had a successful year, and the acreage was much greater than last year.

Pendleton, Oregon, huckleberries are so plentiful that people are flocking from all sections to the mountains for gathering.

Farmers union warehouse at Coleman, Wash., is receiving wheat in immense quantities. One day's receipts showed 5000 sacks.

The water in the irrigating systems near Phoenix, Arizona, is holding up exceedingly well and is giving a full supply to the irrigators.

The first annual meeting of the Pacific Slope Association of Economic Entomologists was held at Portland, Ore., August 20 and 21.

Farmers and orchardists of Colorado estimate an income of $110,000,000 from their crops this year. Last year the total return was $70,000,000.

The Wenatchee Valley, Wash., Fruit Growers Association announces that it will have about 200 cars of high grade apples for shipment this year. The association is advertising for sealed bids for the entire output.

A deal was recently closed at Kennewick, Wash., whereby the Commercial Orchard Land Co. has invested $1,000,000 in Horse Heaven lands, which will soon be covered with irrigation water.

The endorsement by the Association of State and National Berry and Food Departments convened in Denver last week, of the decision of the National Food Commission which permitted the use of benzoate of soda as a food preservative, has caused much comment the country over.

At the meeting of the American Association of Farmers Institute workers at Portland last week, the following officers were elected for the coming year: President, G. A. Putnam, Toronto, Ont.; vice-president, A. M. Soule, Athens, Ga.; secretary treasurer, John Hamilton, Washington, D. C.; executive committee, W. G. G. Clarke, Berkeley, Cal.; Vale Keyser, Lincoln, Neb.; Franklin Dye, Trenton, N. J.

# For Eggs Next Fall Feed Now

# West Coast Egg Food

Don't make the common mistake of supposing that you can let the fowls get all run down before or during molting and then bring them up by heavy feeding later. You won't get eggs that way. They must be kept in good condition and fed feather producing and egg making food. We know how to make rightly balanced rations for such purposes. That is our business, and we have the best equipped mill for doing it, or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg Food, as good as anybody can make, by using

# EGG MORE

and you will get no unsound grain, no mill refuse and such stuffs, as are in many concoctions called Egg Food. Egg-More is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs if you feed it just a little each day. 25 lb. sack, $1.90; 50 lbs., $3.60; 100 lbs., $7.00. If not kept by your dealer we will prepay freight within 300 miles.

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### GET READY TO SHOW.

(By Mrs. Frank Metcalf.)

ALL who have extra good specimens of poultry should take pains to exhibit their best birds at fairs and shows in the most attractive manner. The dark colored birds will need washing, only as to feet and beaks, but their plumage may be brightened perceptibly by being well smoothed with an old silk handkerchief, being careful to rub only the way the feathers grow, never "against the grain." If the combs seem a little pale wet a rag in alcohol and rub lightly, and the color will brighten considerably. Weigh your birds and compare with Standard weights, but do not leave a good bird at home because he or she may fall short a pound or two, for many do that, and no judge expects a 100 point bird, and would likely drop dead of surprise if he found one.

The white birds must be washed and washed well, then dried throughout in a warm place where no draught of wind can strike them during the drying process. Anyone who has never washed a lot of birds for showing, will find this a difficult task, but it can and must be done. At midday, at this time of year, a room exposed to the sun should be plenty warm enough, if no open doors or windows are allowed.

Have ready three tubs of warm water, one a lather of excellent soap suds, for no soap must be rubbed directly on the plumage, remember. One clean warm water for rinsing the suds well out, and one slightly blued for the last rinsing.

Take the bird in the left hand, plunge it under the soapsuds up to the head and rub well into the feathers, working clear down to the skin and working quickly as possible to do a thorough job, wash the head last being careful not to get the soap into the eyes. Now squeeze out all the soap suds possible and plunge into the rinsing bath, and go through the same thorough process to get all the soap suds out, or the feathers will be sticky when dry. Lastly plunge into the bluing water, squeezing as before. Place in a dry coop facing the sun with plenty of shavings or clean straw.

The feet and legs should be left to the last as that is too tedious a job to finish all at once. Two tubs will be all that are needed for this, one of soap suds, and one for rinsing. A small brush is useful here to get the dirt out of the scales, although a toothpick may be necessary for the best results, painstakingly cleaning under each scale, and nail. A very little sweet oil may be rubbed over the shanks and feet when dry, which improves the gloss lost through the washing process.

If there is no sunny room where this work can be done it would better be done where there is a fire, say an oil stove, even.

Plenty of soft old cloths should be at hand to dry them on after the last rinsing, as this will help greatly in hastening said drying process. If your farm has a name, (as it should certainly have), make some neat coops, paint them a pretty, light color and stencil the name of the variety, your name as breeder and the name of the farm where they were bred upon the box and exhibit them in these.

A pair should have a box at least 18 inches square and 24 inches high.

Figure 2.

A pen (four females and a male) should have a box three feet square, with wire netting on three sides, or just front and back as desired. These crates may be kept from year to year and if taken care of, will last almost a lifetime.

Now, in mating up a pen, remember that they don't all have to be of the same age and you can show part hens and part pullets, just so they are uniform as to color and size. And furthermore, a bird in a cage, nicely cleaned up and on exhibition seems to take on an added attractiveness, and outshine his equally good brother strutting around in his everyday clothes at home. Wonder if they are not a little like humans in this respect.—Mrs. Metcalf.

### THE FEEDING TROUGH.

The difficulty of keeping the feed clean and dry during continued exposure is nearly overcome by using troughs with slatted sides and broad, detachable roofs( figs. 2 and 3). The troughs are from 6 to 10 feet long, with sides 5 inches high. The lath slats are 2 inches apart, and the troughs are 16 inches high from floor to roof. The roofs project about 2 inches at the sides and effectually keep out the rain except when high winds prevail.

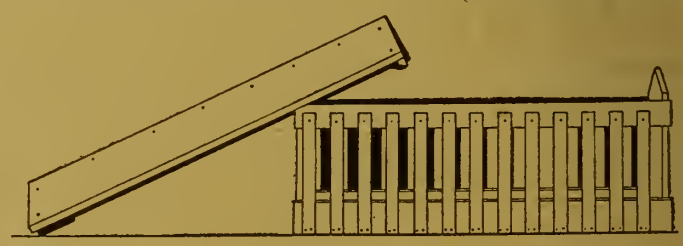

Figure 3.

The roof is very easily removed by lifting one end and sliding it endwise on the opposite gable end on which it rests, as shown in figure 3. The trough can then be filled and the roof drawn back into place without lifting it. This arrangement is economical of feed, keeping it in good condition and avoiding waste. When dry mash is used there may be considerable waste by the finer parts being blown away, and on this account the dry-mash trough should be put in a sheltered place out of the reach of the wind.—From Cyclopedia of American Agriculture.

## POULTRY QUERIES.

**Ticks.**

Will you kindly answer a few questions concerning my chickens? They were covered with lice, a gray louse like a duck louse and some large flat ones. I mixed a dip of Napthol Kali and dipped the flock. I examined them a week after, and found a small insect which was black and almost as large as a pin-head. I found these insects with their heads buried in the flesh of the chicken. The most of them were on the breast and under the wings. The odor of the Napthol Kali solution I used is still very strong on all of them. I have never seen or heard of the kind.—T. P. L., Elk Grove.

Our correspondent is up against ticks, one of the worst pests of California. As they burrow into the flesh of the birds, they are almost impossible to kill, and will sap the lifeblood of the fowls until they grow to the size of watermelon seeds. The best way to treat these pests is to dip the fowls in tobacco tea, as is recommended for sheep and lambs. Take one pound of cheap plug tobacco, boil up in one gallon of water, then add six gallons more water and dip the fowls, rubbing the infected spots especially well, and noting results. If not strong enough to cause the ticks to loosen their hold and drop off, make the tea stronger and dip again but think this strength sufficient. The houses and roosts should be well sprayed with the tobacco tea also, and the treatment repeated in a week's time.

This tea will kill any kind of lice, and is the only dip of which I know that is said to be a certain tick-killer, although creolium is claimed to be effective. Sometimes an especially large and vigorous tick will be found which may be pulled out bodily and killed, or its body snipped off with a small pair of scissors, and one will be surprised what a strong hold these fiends obtain in the flesh of their poor victim.

Owls, weasels and all wiid animals are infested with a tick similar to this, and some kinds of wood seem to harbor them. Please report results of using the tobacco tea.—Mrs. Frank Metcalf.

## VALUE OF LAND PLASTER.

The value of land plaster is appreciated by the farmer, and where its action is understood it is liberally used. Were this knowledge more general, land plaster would be used to much greater extent. So with the poultryman, to whom plaster is of great value. The writer will endeavor to make plain its action, and show its advantages to the poultryman.

Land plaster being a sulphite of lime is insoluble until decomposed, which it readily does in presence of nitrogen (ammonia). The sulphuric acid in plaster having a greater affinity for ammonia, leaves the lime and forms sulphite of ammonia, which is soluble. The farmer sows the plaster on his sod after a rain and the ammonia which is constantly given off by the soil is fixed as sulphite of ammonia and gradually fed to the growing plants by the dews and rains, otherwise this ammonia scorches the vegetation and destroys value for food. Notice a cornfield in the drought season; how the leaves curl up and are finally dried up. Now drop a little land plaster in the bud and after a dew, see how quickly it freshens up and looks green and healthy. Cattle turned on a sod that was treated in the spring will thrive and fatten much faster and better than on as good a sod not treated. So fowls will eat the grass that has been freshened up with plaster with greater avidity and they will get lime in its best form, and they will be healthier and do better generally. In the hen house, too, the plaster acts a good part; dusting the dropping board with it makes it easy to clean and keeps it sweet and odorless. The manure is easier handled and is more valuable when mixed with plaster which fixes the ammonia otherwise lost. The writer practically whitewashes his house every morning, after removing the droppings, everything—dropping board, roosts, floor, etc., are heavily dusted with the plaster with the result that there is never an odor and the fowls breathe a sweet, pure air instead of the pungent, irritating, ammonia-laden air. Then, too, lice and mites can not live where plaster is freely dusted. Try the plaster a few days and it will always be used. —The Feather.

---

There is nothing better for growing chicks than a meal of millet now and then, but bury it in litter and make them cratch for it.

---

Beef liver, boiled and mashed with meal, is greatly relished, but feed it moderately.

---

Feed generously if you expect to harvest a generous egg product.

Coulson's
POULTRY FOODS
**Growing Chick Food**

Can be fed damp as a mash or dry in hoppers. Feed it to your chicks up to 3 months old. Gives rapid growth and health.

It will save your grain bill, and you cannot afford to be without it.

# Irrigation and Forestry

## THE PINCHOT-BALLINGER CONTROVERSY.

THE controversy between Chief Forester of the United States Gifford Pinchot and Secretary of the Interior Richard A. Ballinger is one in which every citizen has an interest. It involves an issue of tremendous importance. Its outcome will determine to a great extent whether or not this generation and future generations will have saddled upon them another monopoly, more powerful than any of our present trusts,—a gigantic water power combination.

The people must take sides in this fight, for at bottom it is the people's fight. This fact must not be forgotten. Pinchot and Ballinger now occupy the center of the arena. For the moment they are the principal figures in the struggle. But back of them are two great opposing forces. On the one side is an army of citizens who are determined upon the wise conservation of our natural resources and the protection of the rights of the public in these resources. On the other side are the hosts of Privilege, bent upon securing at any cost, for private exploitation, the natural resources that still remain in the hands of the public.

The differences between Pinchot and Ballinger may be of a personal nature; but all the evidence indicates that they arise from a radical disagreement as to the disposition of the public domain. Pinchot is trying to carry forward the Roosevelt policy. Ballinger has a policy of his own, which is quite different.

What are these policies? A bit of very recent history contains an answer. Shortly before the close of his administration, President Roosevelt got wind of the fact that certain water power interests, and their business allies, were quietly proceeding to get control of the choicest available water power sites on the government lands. The enterprises and the capital behind this scheme, as well as the wide scope of its operation, convinced the president that here was the beginning of a great, national water power trust. Such a monopoly would be in a position to levy tribute upon the people of the country for years to come, for water power will soon replace coal in the production of electric current to turn the wheels of industry. So he promptly took steps to thwart it. He sent experts into the field who reported that the water power interests already had their men out getting maps of the desirable locations. Then he had withdrawn from entry government lands containing water power sites to the extent of millions of acres. His last act as President was for the public good.

Secretary Ballinger had no sooner taken office than he threw open these lands to entry. His first official act was a reversal of the Roosevelt policy and an open sesame to wholesale land grabs. The interests again had a clear field.

But not without protest. The opening up of these lands by Mr. Ballinger had not gone on for many weeks, when the President began to hear from the public. And then certain of these lands were again withdrawn. Ballinger was forced to modify his first order. Washington correspondents state that President Taft summoned Secretary Ballinger and ordered him to restore these lands again to public control. However that may be, restoration was made, to a degree, but not until an opportunity had been given the water power magnates to get in on the ground.

Mr. Ballinger's declaration at the convention of the National Irrigation Congress in Spokane last week, that his policy was to encourage the development of irrigation and water power projects by private capital, together with his statement that in his opinion the irrigated lands of the West were no place for a "poor man," and his action in throwing open the lands containing the water power sites to entry, can mean nothing else but a conviction on his part that the future of the West shoud be placed in the hands of large aggregations of capital instead of parceling the land out to the settler and the homesteader to make into farms and homes under the patronage of the government. His statement that the administration would expend no more money upon irrigation projects gives added force to this conclusion, since without government aid, no other way is left open for the construction of such works except private enterprise, which in this case unquestionably means ultimate monopolistic control.

Mr. Ballinger's policy is very satisfactory to Big Business. The agents and representatives of the corporations who are seeking control of the lands in question were among his loudest defenders at the irrigation congress. If Mr. Ballinger pushed his policy to the extent of securing the removal of Mr. Pinchot, the Interests would be still better pleased. For they fear the Chief Forester. In his implacable opposition to the monopolistic acquirement of the public's water power sites, they find the most serious obstacles to the carrying out of their program. But the people, in whose interest and in whose children's interest, Roosevelt, Garfield and Pinchot prevented the public rights from falling into the hands of Big Business, will have only condemnation for a public official with so little regard for their interests or with so little understanding of the consequences of his trust-favoring policy.—La Follette's.

## OUR TIMBER SUPPLY.

The original forests of the United States, which in the quantity and variety of their timber exceeded the forests of any other region of similar size on the globe, have been reduced by cutting, clearing, and fire from an acreage of 850 million to one of not more than 550 million, with a total stand of some 2,500 billion board feet.

Most of our forests are private property. About one-fifth of the standing timber in the country is held by the Federal Government in national forests, Indian reservations, national parks, and on the unreserved public domain, and by the States in State reserves or other State lands. These public forests contain more than 100 million acres of saw timber.

The private forests are of two distinct classes, (1) farmers' woodlots and (2) large holdings, either individual or corporate. The woodlots are chiefly scattered and detached remnants of the original forests. They are mainly in the eastern half of the United States and cover some 200 million acres, with a stand of perhaps 300 billion board feet of saw timber and 1½ billion cords of wood. Aside from their protective and ornamental value, they furnish much firewood, many posts, poles, and cross-ties, and some lumber and cooperage stock.

The large private holdings contain about 1,790 billion feet. These holdings generally include the best timber in the regions in which they occur. They are the principal sources of the lumber which is used today, and upon the manner in which they are managed depends in a large degree the timber supply of the future.

The value of the forest products of the United States in 1907, the last year for which detailed data are available, was approximately $1,280,000,000.

The fact that timber has been cheap and abundant has made us careless of its production and reckless in its use. We are cutting our forests three times as fast as they are growing. We take 250 cubic feet of wood per capita annually from our forests, while Germany uses only 37 cubic feet and France but 25. On the other hand, Germany makes her state forests produce an average of 48 cubic feet of wood per capita.

The necessity for more farm land may eventually reduce our total forest area to 100 million acres less than it is at present. It is entirely possible, however, to produce on 450 million acres as much wood as a population much greater than we have now will really need if all the forest land is brought to its highest producing capacity and if the product is economically and completely utilized.

In Forest Service Circular 166, entitled "The Timber Supply of the United States," just issued by the Department of Agriculture, the attempt is made to answer many questions which are constantly arising concerning the extent of our forest resources, their ownership, the rate at which they are being cut, and the outlook for a future timber supply.

# The Ames Continuous Flow Deep Well Pumps

Deliver a continuous stream from lower end of cylinder in well to point of discharge.
They run continuously day and night without care or attention except to oil.

All of the valves or working parts of both our single and double acting pumps can be removed, repaired and replaced without pulling up the cylinder or heavy column pipe or moving the power head off of its foundation.

## NURSE CROP NOT BEST FOR ALFALFA

THE practice of sowing a nurse crop with alfalfa was inaugurated when the nature of the plant was not as well understood as now. It was also somewhat on the theory too that "a half-loaf is better than no bread." It began when there was a good deal of doubt about "getting a stand," and the farmer thought no doubt that a crop of oats or barley would pay for the plowing even if the alfalfa failed. While the practice is continued by many, the prevalent later method is to provide no nurse crop. Few who have abandoned the nurse crop have returned to it. The alfalfa plant does not need protection from the sun, nor is it bettered by dividing any of the soil moisture or fertility with another crop. On the other hand if alfalfa is sowed in the spring, it is important that it obtain an early start in order that its roots can quickly work down into the moisture of the subsoil, against the dry days of July and August. When a nurse crop of any vigor is removed the alfalfa plants are likely to be found weak, spindling and with little root growth; the nurse crop has also taken up some of the soil nitrogen needed by the young alfalfa; or if the nurse crop is heavy and has lodged, there will be left bare spots, where the alfalfa has been smothered out.

Cutting the nurse crop is likely to be attended with no little damage to the tender alfalfa plants by trampling their crowns into the ground, or breaking them off. Practically all the experiment stations favor sowing alone. With few exceptions the second and third years have brought heavier yields where no nurse crop was used. The theory that the nurse crop will prevent the weeds choking the alfalfa is apparently, as a rule, not well founded. In the first place alfalfa should not be sown on foul land, and in the second place proper disking and harrowing, at near intervals for four or six weeks before sowing, will disturb or kill far more weeds than can any nurse crop. Besides, the oats or barley sown as a nurse will when cut leave weeds in good growth, or dormant and ready to spring up as fast or faster than the alfalfa. No nurse crop is ever used with fall sowing. When ground has been properly prepared for the preceding crop, and then properly cared for, and made ready for the alfalfa by the preliminary weed destruction, it will be found advisable to sow alfalfa alone, even in the spring.—From Coburn's "The Book of Alfalfa."

## PLANT BREEDING.

It is probable that the department of agricultural science which will most benefit the human race in future years is that of plant breeding. Hitherto but little has been achieved by the scientific plant breeder, that is, little in comparison with the boundless store of varieties of plants suited to fulfil peculiar economic conditions which, it is predicted, will be evolved by the operation of principles which are now coming to be understood and successfully applied. It is true that our cultivated varieties of fruits, flowers and grains have been produced from elementary ancestors of little resemblance to their luxuriant descendants, but the process of evolution has been achieved only after great duration of time and often under methods whose true scientific principles were little understood. At first primitive man gathered from their native habitat the few uninviting roots and seeds with which he appeased his hunger. The first step towards improvement of such food plants took place when in order to save the labor of gathering, he planted them near his home and aided their development by working the soil and discovered the beneficial use of fertilizer. Then commenced a long and slow period of advancement. By selection of the more promising plants as parents for the new crop, the hard woody qualities of the primitive ancestors of our vegetables developed into the soft and succulent varieties of our garden crops. The hard and acrid berries of the vine and tree mellowed into the generous and luscious grape, apple and peach.

All this, however, necessitated many centuries of laborious work and many of the advances taken were no doubt unconscious. At length in China and ancient Rome the breeding of plants came to be looked upon as a regular profession, and to these countries and to the members of the monastic houses of the middle ages are to be attributed many of the most direct advances in plant production. It is only now, however, that the principles lying at the basis of the improvement of plant stocks are beginning to be applied and that scientific agriculturists are consciously breeding plants for specific purposes. Given time, and that a not too distant date, the modern plant breeder will produce types of plants to resist particular fungus and insect pests; he will evolve varieties of economic plants to flourish in climatic conditions now considered impossible for their existence; he will multiply their production three-fold; and finally by combination he will produce new breeds of plants of entirely new type.—Hawaiian Agriculturist.

---

J. E. Woodford, of Coffey county, Kansas, April 1, 1905, placed ten choice pure-bred Poland-China brood sows from 12 to 18 months old, that were due to farrow in the latter days of June, on a five-acre field of alfalfa. They were given no other feed than the alfalfa pasturage until they had farrowed and their pigs were a week old. After that the sows had in addition to the alfalfa some bran slop until about August 20, when new corn was fit for feeding. He wrote: "The sows from the time they were turned on the alfalfa until the last week in June made a remarkable growth, besides gaining somewhat in flesh. They did well with their pigs, reared an average of seven to each sow, and as sucklers they were a sight to see. The pigs were the most attractive bunch ever raised in Coffey county, as admitted by our breeding competitors. We weighed a gilt from this lot when six months and five days old, and her weight of 225 pounds was not above the average of the whole lot. In our lifelong experience in rearing swine we have found nothing as a grazing crop for swine that in value approaches alfalfa."—From Coburn's "Swine in America."

**Genasco Ready Roofing**

Genasco is economical roofing.

It costs a little more in the beginning because it is made of Trinidad Lake Asphalt, the perfect natural waterproofer and weather-resister.

The thing that makes the first-cost more makes the last-cost less. And last cost is what counts.

Get the roofing whose composition you know—the Trinidad Lake Asphalt roofing backed by a thirty-two-million dollar guarantee. Mineral and smooth surface. Look for the trade-mark. Write for samples and the Good Roof Guide Book.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

## QUERIES.

So many questions come to the Cultivator for answer with insufficient detail to enable us to give intelligible reply, that we again make a few suggestions. There is no necessity whatever for a long, rambling letter touching all around the subject, but rather a few concise statements defining exactly the situation, with, so far as can be judged, an indication of the cause of the trouble. We feel that one trouble with some inquirers is lack of observation and, if the Cultivator may be pardoned the suggestion, that is just what the farmer needs in order to meet successfully his varied problems. Very often queries come in regarding questions which have been answered many times and sometimes only a week or a few weeks prior to sending them in. For example, the question of aphis. We do not believe there has been a week during the past six months when questions regarding this pest have not been received at this office. After we have repeatedly referred to the fact that ants herd and care for the aphis and live upon the honey dew which they exude, still there continue to come in references to ants destroying the tips of tender growth, with sometimes incidental reference to "small soft green bugs" also occurring on the same tender tips. Now a close observer will soon see that these soft green bugs are doing the mischief, and the ants do not in any way injure the plants except that they protect and sometimes aid in spreading the aphis.

Hence we say, look at all conditions surrounding the plant or insect about which information is desired.

State fully the symptoms and description of the trouble as seen.

If the information desired can be better secured by sending in leaves or entire plants, wrap the specimens in moist (not wet) paper and get them to the office as soon as possible. Recently a pea vine, which so far as could be determined was seriously affected with mildew, was received in such a dried condition that there could be no assurance that such was the case.

We wish to make the query column the most helpful feature of the Cultivator, and it is a question of no little expense, so we ask you to aid us to give as intelligent answers as possible.

Also bear in mind that one of the essentials for securing prompt and proper attention is the sending of the full name of the writer. If you wish only initials or name other than your own to appear at end of question in the paper, they may be signed immediately after the communication to us, but the full name should be written below that or somewhere in the letter so that we may know from whom it comes.

Do not be impatient if the answer does not appear the week following the mailing of the question. In all probability the question has been mailed to some contributor or specialist particularly qualified to answer. Some, of course, are answered in the office. Again, others are such as must be referred to practical experts, some even at the northern end of the state. Therefore, allow us a week or two for reply.

### Fleas.

Please tell me how to rid a place of fleas. They are in, around and under the barn, and under the house. They are of a very small variety, but terrors to the chickens.—E. D., Auld, Riverside Co.

The best remedy for fleas is a thorough and absolute cleaning up of the pemises. If possible, tear up the old floors and take out the dirt which is abounding in decaying wood or vegetable matter, which affords a breeding place for the young, and whitewash everything. If they are troublesome in the house, the taking up of carpets, replacing by rugs that can be cleaned often and thoroughly, will help matters. The little fellows are so exceedingly lively that the place may not be so thoroughly infested as may appear. If the space underneath house or barn is enclosed so that sulphur fumes may be retained to suffocate the fleas, that will be beneficial. Spraying with insecticides will also help.

### Eucalyptus For Moist Land.

In regard to J. K. G. inquiry as to eucalyptus for moist land, I have rostrata growing on land that has been four feet under water as late as July, and the wetter it was, the better they grew. I find rosrata will stand more frost than blue gum.—A. E. R., Laton.

### Green Aphis.

Please let me know if the insect on enclosed pea vine is the green aphis. It has practically destroyed the pea crop of Humboldt county. Can it be effectively controlled? Have tried weak solution of coal oil, also tobacco tea. Either kills those that are exposed, but many are protected by the leaves.—J. B. M., Loleta.

The specimens sent are green aphis which is very destructive this season. In large fields as soon as it begins to infest the vines, they should be destroyed to prevent spread of the pest. They are easily reached with any weak insecticide, but reproduce with such fearful rapidity that spraying is of little value.

### Grape Juice, Bleached Raisins.

Please tell me how to prepare unfermented grape juice, also how to bleach raisins.—A. M. Starr, Ontario.

For information as to preparing unfermented grape juice see Cultivator of September 12, 1907.

Raisins are sometimes dipped in a solution made of one pound of potash and twelve gallons of water, the solution to be boiling hot. The ripe fruit is dipped in this boiling liquid for an instant, then plunged in fresh water for a thorough rinsing and placed on trays to dry. If the weather is dry, as it usually is at this season of the year in the interior, the raisins will dry very quickly and have a very handsome amber color. The drying is often done with trays stacked to prevent over drying if the weather is very hot and dry. Wickson gives an oil dip for raisins as follows:

One quart olive oil; ¾ pound Greenbank soda and 3 quarts water are made into an emulsion, and then reduced with ten gallons water in the dipping tank, adding more soda to get lye strength enough to cut the skins, and more soda has to be added from time to time to keep up the strength. The grapes are dipped in this solution and sulphured to the proper color.

### Sequoia Gigantea.

Is it probable that the sequoia gigantea will live under cultivation to a mature age? It is a beautiful tree and I wish to plant it, but know of a tree at Pomona planted on a lawn which died when about twenty years old.—X. Los Angeles.

This query was referred to Mr. W. V. Eberly Manager of the California Nursery Co., Niles, Cal., because of the fact that on the gounds of that nursery is one of the largest trees of this variety which we have seen under cultivation. Mr. Eberly replies:

Replying to your favor of August 12th: We do not think anyone knows how long Sequoia gigantea will live, even in a cultivated state. We have one specimen on our grounds that is now 50 feet high and is about 25 years old. Each year it seems to look better and grow faster.

We judge that the trees that you say died at Pomona either got too much water or else their roots went down to hardpan or some unsuitable soil condition.

There is hardly any doubt in our minds that cultivated trees, if the soil and moisture conditions are right, will live to be as old as they do in their natural forests; at least can see no reason why they will not. There are a number of large trees around Niles. All of them look healthy and are growing larger every year.

### Belgian Hares.

How large should a Belgian pen be? What is the best way to build it? Where could I get thoroughbred stock?—A. S., Chico.

A pen for adult stock should not

**Power Sprayer**
**For $85.00**
**Complete as Illustrated, Without Hose or Nozzles**

Most complete low priced power sprayer on the market.
Bronze plunger, gland and valves.
Large air chamber.
Positive agitator.
Relief valve and pressure gauge.
Air cooled gasoline engine.
Uses only one pint of gasoline every three hours.
100 lbs. pressure with six mistry nozzles.
**FREE** How to spray, when to spray, what sprayers to use.
**Smith-Booth-Usher Co**
**Machinery and Supplies**
212-214 S. Los Angeles St., Los Angeles
Home, 10661—Sunset, Main 1090

be smaller than 3x4 feet and about 2 or 2½ feet high and as much larger as space will permit for brood does.

The pen should be free from drafts and direct sun, and must be dry. We found the most satisfactory pens to be those built against a solid wall, the wall forming the back of the pen, the front and sides being of one inch mesh wire netting.

There should be a tight board floor and where the pens are built one above the other the floor should be of matched stuff to make it water tight.

Do not neglect a strip of board about 1x3 around the floor of pen forming a base board, otherwise the young leverets will manage to fall through the wire. The method of building hutches was gone into at some length in a former number of the Cultivator (page 42 of issue of January 14, 1909). I am unable to tell you where you can obtain thoroughbred stock, but would suggest to some of the readers of the Cultivator who have good stock for sale, that it "pays to advertise."—Bee Josephine O'Mealey.

### Gum On Fruit.

Many of the peaches on my small trees show drops of gum on the fruit. Some of the trees are entirely free from this affection. What is the cause, and has spraying with Bordeaux anything to do with it?—F. P., Porterville.

The presence of gum on the fruit is due to physical condition of the tree and spraying has nothing whatever to do with it. It is sometimes prevalent after heavy pruning, and sometimes comes without any apparent cause. Like splitting of pits and some other problems, it is yet to be solved.

### Gypsum.

An inquirer wishes to know the value of gypsum as an absorbent of odors, and as of general advantage in poultry houses. Also, does it make the droppings of more value as fertilizer?

Gypsum, or land-plaster, is considered one of the best of absorbents and deodorizers that can be used in the poultry house, and makes the droppings more valuable by absorbing and retaining the volatile matters which escape through the air by evaporation, etc. It should be used by sprinkling freely under the roots, and the droppings kept under shelter from rain as gathered, preferably in barrels and boxes, either under a shed, or covered well to protect from dampness, which will cause the valuable properties to escape to some extent.

## NOT PIONEERING.

We find the following item in the "California Cultivator" current number:

"The city of Vallejo is taking up with one of the first experiments of its kind, in this, that it will plant a large number of eucalyptus trees on 500 acres of waste land near the site of the municipal water works."

Guess again. San Bernardino's water department put out 10 acres of eucalyptus in May, 1908, which same averaged considerably higher than a man's head in May, 1909, a year from the planting, with many specimens reaching from 10 to 12 feet in height. Not only so, but 22 acres more are to be planted at another reservoir, since the first experiment has made such a magnificent showing. The Vallejo people seem to be going in on an extensive scale, if 500 acres are to be planted, but San Bernardino will have to lay claim to the first step in the way of utilizing waste land. Fifteen or 20 years hence, the wood will be no small item of income.—San Bernardino Sun.

## HOW TO GET GOVERNMENT LAND

The General Land Office at Washington does not issue maps showing the location of vacant public lands subject to entry; neither will any specific description of the land, water, climate or timber be given.

Persons who desire to take out homestead or desert land claims must themselves find and decide upon the lands. They should then write or go to the local land office of the district in which the lands are situated and obtain from the records diagrams of the vacant lands. Information as to whether or not a particular tract of surveyed land has been filed upon may be obtained upon inquiry. The register and receiver will give advice as to law and procedure, but are not officially cognizant of the character of unentered lands, and are not expected to give information regarding same; neither are they expected to furnish extended lists of lands subject to entry, except through plats and diagrams which they are authorized to make and sell as follows:

For a township diagram showing unentered lands only----------$1
For a township plat showing form of entries, names ofclaimants and character of entries----------$2
For a township plat showing form of entries, names of claimants, character of entry and number------$3
For a township plat showing form of entries, names of claimants, character of entry, number, and date of filing or entry, together with topography, etc. ----------$4

Such maps are open to inspection in all local land offices. Writer's applications for these maps should be accompanied by remittances of the proper amounts to the receiver of the office, and should state the number of the townships and ranges for which plats or diagrams are desired.

The United States Geological Survey issues atlas sheets which show United States township and section lines; located township and section corners; and township and section corners not found. Some stationers have these maps on sale at five cents a sheet.

When the intending settler has decided upon the region he desires, he is required both under the homestead and desert lands laws to inspect it in person. For those who desire further and fuller information than can be put into this brief space, application in person or through the mail to the local land office will secure two circulars, one containing suggestions to intending homesteaders and the other to those desiring to enter land under the desert land act. Land laws may be had by application to the General Land Office, Washington, D. C.—Ex.

## AVOIDING RUST.

Many housekeepers do not seem to be familiar with the fact that pins and needles are not likely to rust in a cushion filled with coffee grounds. The grounds have already served to make a beverage. They are merely poured from the pot, rinsed in cold water and dried in the sun.—Washington Times.

New building, new equipment; located in the best business district. One of the lightest, most convenient and best-equipped business colleges in America. Write for information about the great opportunities offered to trained office workers in the new San Francisco.

# Angle Lamp

## The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

**NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.**

**GREAT ECONOMY—COST LESS TO BURN** than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT,** soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

***Send for Illustrated Catalogue with Prices***

**Boesch Lamp Co., 1135 Mission St., San Francisco**

Established 1869 Incorporated 189

# SECOND HAND PIPE

We will sell you pipe that can be used for any purpose. ***Satisfaction guaranteed*** or money returned. We handle all sizes of standard pipe and casing. Shipments made on same day as order is received. Price of pipe is low now. Write for our prices.

***Pacific Pipe Company***

***S. W. Corner Howard and Main Streets, San Francisco, California***

### I CANNOT SING THE OLD SONGS.

I cannot sing the old songs,
Though well I know the tune,
Familiar as a cradle song
With sleep-compelling croon;
Yet though I'm filled with music,
As choirs of summer birds,
"I cannot sing the old songs"—
I do not know the words.
I start on "Hail Columbia,"
And get to "heav'n-born band,"
And there I strike an upward grade,--
With neither steam nor sand;
"Star Spangled Banner" downs me
Right in my wildest screaming;
I start all right, but dumbly come,
To voiceless wreck at "streaming."

So, when I sing the old songs,
Don't murmur or complain
If "Li, diddy ah da, tum dum"
Should fill the sweetest strain.
I love "Tolly um dum di do."
And the "trilla la yeep da,' of birds,
But "I cannot sing the old songs,"—
I do not know the words.

—Rev. Robert J. Burdette.

### ROBINSON'S DETECTIVE WORK.

I WAS telephoning Randall about a business detail that had popped into my head just as I was leaving the theater, when the thing happened.

"I am sure that number is not busy," I assured the operator, and there followed the usual provoking silence. "Plague take it," I muttered, when I heard something like a moan through the 'phone.

"My God, they'll kill me!"

I almost dropped the receiver in surprise. The words, uttered in a low tone evidently a woman's, had the effect of coming from blank space. The shock set me to quivering.

"They'll be back in a moment. They'll have no mercy Help me, for God's sake."

The words came jerkily over the 'phone, cut into sentences, and were spoken in a repressed fashion as if the speaker were trying to conceal them for someone. But they began to grow louder and more charged with emotion.

"They can't be gone much longer. I think I hear them on the stairs now. Good God, they're coming! Help me! help me! They're—"

It was Randall's blatant voice that broke in. "Hello," he said. "Hello. Well?"

"Hang up your receiver," "I shouted, "This is me, Robinson. Hurry, you idiot. Something terrible's happened."

It took an endless time to make him understand. The moment he did cut off I began violently to work the receiver-holder of my phone in an effort to attract the operator's attention. There was a snap somewhere. The 'phone suddenly became absolutely dead. It took me some time to realize this; then I jammed it down on the the desk and ran to the door.

As I opened it, a cab was creeping by. Hailing the driver, I jumped in. "Go like the devil," I said, and gave him the address of the west exchange with which I knew my 'phone was connected.

I fairly gnawed my nails to the quick as the driver whipped his horse along at top speed. The words were ringing in my ears: "Help me! Help me!" What had happened?

Around the corner we whirled and the lights of the exchange flashed into sight. "Walt," I shouted to the driver, as I leaped out and dashed up the stairs. A girl pointed out to me the manager.

"The forces have just been changed," he said. "The operator on your line has gone home."

"But can't anyone else tell me what 'phone I was connected with?" I exclaimed.

He said they couldn't.

Then another resort came into my mind. "Where does the girl live? I'll go to her home."

He asked each separate girl and none knew. I was growing desperate when the boy who did odd jobs said he thought she lived with her aunt on Queen and Oak streets in the Millsworth suburb. The next instant I was in the cab, driving like fury. The Millsworth suburb was six miles away. It was three o'clock when we reached there. The girl and her aunt had moved back within the city fully ten miles from where we were. As soon as possible I changed cabs, for the horse I had been using was utterly done up. "Drive for all you are worth," I said to my new cabby.

The words I had heard over the 'phone kept running through my brain: "Help me, help me!"

There was a growing light in the east when we stopped before a small frame house. Aching in every joint from my hard drive, I ran up the steps. Bur-er, went the bell. There was a wait, the patter of feet, then the gas in the hall was lighted.

I shouted who I was and whom I wanted to see.

The door cracked and a head done up in curl-papers appeared. "I'm her. What's the trouble?"

I told her, clenching my hands, knitting my brows, filling my tones with dramatic emphasis the while. She started, slowly her eyes opened, then her mouth expanded into a smile. For a moment I stood unbelieving.

"But, do you understand?" I cried. "This is a life and death matter. Whom was I connected with?"

"Me."

"What?"

She extended a yellow-back volume through the door. "I had got to the third chapter, just where the princess had been thrown into the dungeon, when I had to go on duty; so I took the book along with me, and was reading a bit out to Mamie Moore when you asked for a number. Listen: 'My God, they'll kill me! They'll be back in a moment. They'll have no mercy. Help me for God's sake. They can't be gone much longer now. Good God, they're coming! Help me, help me! They're—' The boss came along about that time."

I turned brusquely away. "Good night," I said.

She giggled.—Universal Magazine.

### WHY SHE DECLINED.

"Really," said the stylish lady, enthusiastically, to her friend, "it is quite worth while going to the Zoo, if only to see the wonderful display of rhododendrons."

"Is it?" replied her friend, languidly; "I like to look at the great big clumsy beasts, too, but it always smells so unpleasantly round the cages."—London News.

## THE HOME LAUNDRY.

This subject, like farming, is one about which everyone knows—or thinks he knows. That so many of us are, then, wearing grimy linen, must be ascribed to the perversity of Colorado sunshine, Colorado water, and the numberless "ines," powders, and Aunt Hannah soaps that flood the market. That one day in seven has come to be synonymous with steamy houses, cold dinners, and ill-temper, again, must be that we are visited by the perversity of fate, and so we try to become reconciled to this ill to which we are heirs.

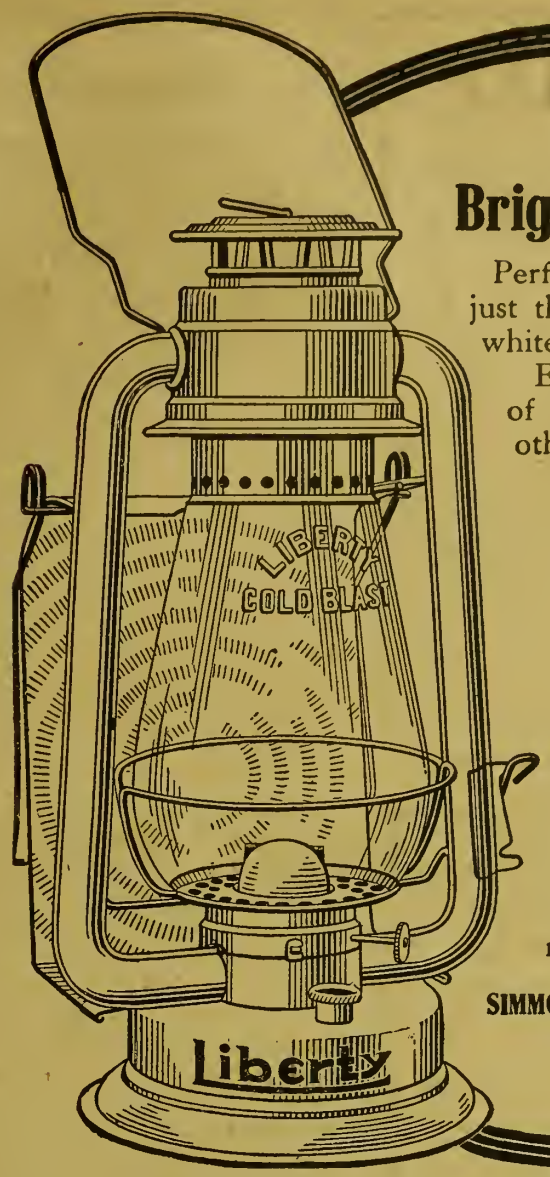
There must be a "screw loose," and until the time comes when clothes shall be laundered at some public establishment, with no greater expense in the aggregate than in the private kitchen or basement, it may be well to seek out the difficulty and then a partial remedy, at least, for the conditions that prevail.

The first point of attack is the laundry room, if such a room has been set aside in the basement, or at the rear of the house. Into this it has not appeared to be worth the while to carry wholesome conditions and comfortable environment. We dream over Turkish corners, dens, and mission finish for the front part of the house, giving no thought to plans for this room in which someone must spend in routine work of the household, no less than one day in each week—fifty-two days in the year. In the matter of the laundry room and its equipment, the average house is of the type of Queen Anne front and Mary Ann back. This criticism is not in the way of a plea for architectural beauty. The laundry room should be humble, but let it at least comply with these essentials—provision for ventilation, abundant light, and opportunity for maintaining cleanliness. In the house where the kitchen serves the laundry purpose, the emphasis is the same.

The next consideration is that of equipment. In this some things may be regarded as accessories; others as "must haves." As a rule, no part of house furnishing is so limited, and even destitute. A quotation from a laundress who went out to service and also "took in work," gives a view of the common state of affairs. In apologizing for a delinquency, she said, "My hands were so sore I just couldn't get all the ironing done. I went to Mr. Brown's Tuesday, to wash, and the wash board was so bad I cut my hands all up. You see, Mr. Brown is the president of the First National bank. They are rich folks and have all their work done, so they don't know what one needs to work with."

There are excellent labor-saving devices, but they do not dispense with brains. If the device is a washing machine, understand what, at best, should be expected of it. Keeping in mind that washing is forcing water through clothes, and that soap and heat, each at a proper time facilitate the cleansing action of the water, select, then, the machine that best does the work. Several may accomplish this equally well. Know this. Know that these devices, which are often regarded merely as accessories, will prove no less advantageous than the separator in the dairy, and that greater wear and tear of clothes is of less consequence than the saving in time and energy Know that sanitary and comfortable floor covering, that cleanly and attractive walls, that proper tools for work, are not prohibitive in cost. Know the degree and character of the hardness of water, and how to remedy it. Know the relative value of cleaning agents—soaps and washing powders, the value and worthlessness of bluings. All such information is available to the earnest inquirer.

With this accurate knowledge comes skill, and with skill, greater joy in work. It is largely a matter of desire and intelligence that is to determine whether or not the "wash day" of today and tradition shall remain.—Inga M. K. Allison, Colorado Agricultural College.



A
**Bright White Light**

Perfect burners supplied with air in just the right quantity to give a clear, white, far-reaching light.

Every device is the very newest, many of which are not to be found on any other makes.

**Liberty Lanterns**

are air-tight and oil-tight. The globe lifting device is the simplest and easiest—the bail will stay in any position—the globe is of the best lead flint glass. Heavy spring coils in canopy hold globe steady and prevent rattling.

Prices from 60 cents to $3.50. If not at your dealer's write us.

## RECIPES.

Mix thoroughly in one and one-half quarts of flour, one tablespoon of butter and one tablespoon of lard. Scald one pint of milk and when it has become cool, add one-half teaspoon of salt, a scant cup of sugar, and a dissolved yeast cake. Place the flour in a deep mixing bowl, make a well in it and into this pour the yeast and let it stand for several hours until very light. Mix all together, knead one-half hour and let rise. Roll out in a long strip with the rolling pin, cut in small pieces and rub with butter, put in pan, let rise the second time, the bake.

**Bread Tarts.**

Cut white bread into thin slices, then in rounds with a biscuit cutter. With a pastry brush the surface is moistened lightly with milk, spread with any kind of jam or marmalade and lay two together. A little butter is heated in a heavy frying pan and the tarts are fried to a delicate brown on each side, sprinkled with powdered sugar and served hot.

**Cod Fish Cones.**

Pick enought salt codfish into small pieces to make two cups. Soak over night, drain and bring to the boiling point. Make a white sauce by melting two tablespoons of butter and blending it with two tablespoons of flour and one cup of hot milk, cooking to a thick cream. Have ready one pint of hot, seasoned mashed potatoes. Beat the fish into sauce, add the potatoes, mix thoroughly and form into small cones. Place them on a buttered baking sheet, brush with melted butter, sprinkle with bread crumbs and brown in the oven.

**Rice as a Vegetable.**

The correct way to cook rice is to have each kernel dry and separate from the rest; this is done by boiling a cup in five or six cups of water. After washing the rice thoroughly pour it into the boiling water, salt to taste. Let it boil twenty minutes. If necessary pour more boiling water into the pan, but do not stir with a spoon. Mash a kernel of rice between your fingers, and if soft, pour all into a collander, allowing it to drain into a pan. Serve as soon as drained. It is often eaten with a curried meat stew. The rice water may be used for soup.

**THE SAVINGS AND LOAN SOCIETY.**

## THE FIRELESS COOKER.

Our modern civilization has evolved many labor-saving devices for women, which in comparison to the old-fashioned methods render housekeeping extremely easy. Hence the country woman has reason to welcome the fireless cooker and she should not allow prejudice to keep her from fully investigating its claims. The name fireless cooker is somewhat misleading; heat retainer would have been better, as the principle upon which it cooks is that the heat is retained by insulation after the food has been brought to a boil on the flame or coal stove. This principle has long been known and used in Europe and its practical adaptation to the needs of the American housekeeper is destined to revolutionize the burden of cooking three meals a day.

By means of the fireless cooker the farmer's wife can start her vegetables, meat and soup to boiling while she is cooking breakfast and have them snugly packed away in the cooker half an hour later to be taken out "piping hot and done to a turn" for dinner In the meantime she has a cool kitchen in which to wash up her breakfast dishes, churn and do the many other things that fall to the lot of a woman in the country.

One farmer's wife, writing of the fireless cooker, says: "It is the greatest help to women of the age and the greatest saver of fuel and labor. My dinner is all in the cooker now and it has been for three hours. My kitchen is nice and cool and I have taken a good rest. No running to see about fires, just leave it alone and when wanted all will be done 'to a turn.' "—An Expert Cook.

# San Francisco and Los Angeles Produce Markets

## Los Angeles Markets

LOS ANGELES, Sept. 1, 1909.

### Butter.

The warm weather has diverted such a large proportion of cream to the ice cream trade that butter is becoming scarce and price will doubtless make early advance, lower grades are higher than last week.

Produce Exchange wholesale quotations are as follows with actual selling price to the trade 2½c advance on Extras.

| | |
|---|---|
| Creamery per roll | 60@62½ |
| Dairy per roll | 30 |
| Eastern creamery per lb | 30 |
| Cooking | 25 |
| Ladles | 26 |

### Cheese.

| | |
|---|---|
| Southern California Anchor | 20 |
| Northern fresh | 17½ |
| Anchor Young America | 21 |
| Domestic Swiss | 21@23 |
| Imported Swiss | 30 |

### Eggs and Poultry.

Eggs are in lightest receipt of the entire year. No material advance is noted, but a firm condition prevails.

Paying price f. o. b. L. A. are:

| | |
|---|---|
| Eggs | 34@37 |
| Case count buying price | 31 |
| Eastern | 30 |
| Storage | 28 |

Dealers pay for live poultry f. o. b. L. A.:

| | |
|---|---|
| Hens per pound 3½ up | 15 |
| Stags and old roosters | 7 |

| Rolled Barley | 1.50 |

## San Francisco Markets

SAN FRANCISCO, Aug. 31, 1909.

### Butter.

Butter declined last week to 31, then on Monday advanced a half cent where it now remains. Some sales were made yesterday at 32, but the general range is about as quoted below:

The official quotations of the San Francisco Wholesale Dairy Produce Exchange for today are as follows:

| | |
|---|---|
| California extras per lb. | 31½ |
| California firsts | 29 |
| California seconds | 27½ |
| Packing | 24½ |

### Cheese.

| | |
|---|---|
| California flats | 14½@17 |
| Cal Young America fy | 15@16½ |
| Young American Oregon fy | 16½ |

### Eggs and Poultry.

Eggs took a sharp decline after last week's quotations, dropping six cents. Recovery began on the 27th, and they now stand at 38 for extras with firm market.

Official quotations of the S. F. Wholesale Dairy & Produce Ex. are:

| | |
|---|---|
| Fresh ranch | 24@38 |
| Hens per doz. | 4.50@9.00 |
| Roosters | 4.00@9.00 |
| Fryers per doz | 5.00@5.50 |
| Broilers | 3.00@4.00 |
| Geese per pair | 1.50@2.00 |
| Ducks | 4.00@8.00 |
| Pigeons young | 1.00@2.25 |

### Live Stock.

San Francisco prices gross weight:

| | |
|---|---|
| Steers | 2¾@4¼ |
| Cows and heifers | 2@3¼ |
| Hogs | 4½@7½ |
| Calves per lb | 4@5¼ |
| Milk lambs | 5¼ |
| Wethers No. 1 | 4¼ |

| Light Amber | 10@12 |
| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

During the week just passed we have received 4500 tons of hay on the San Francisco market. The purchasing of hay in the country of late has been restricted mostly to choice types only. Choice lots of hay find a sale at quotations. Fair to medium and also the poorer grades, are dull and neglected, and any purchases that are being made in the country of these medium grades of hay, must be done on a very much reduced basis.

Alfalfa hay is beginning to arrive here now freely. The demand is quite active, but the tendency of the market is decidedly easy. Large quantities of alfalfa are being offered freely in various sections, but same cannot readily be handled on satisfactory results at this time.

Straw has arrived more freely and the market on this article is a little lower.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 17.50@18.50 |
| No 1 wheat or wheat & oat | 16.00@17.00 |
| No 2 wheat or wheat & oat | 13.50@15.00 |
| Choice tame oat | 16.00@17.00 |
| Other tame oat | 12.00@14.00 |
| New crop wild | 11.00@14.00 |
| Stock hay | 8.50@9.00 |
| Alfalfa | 10.00@13.50 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.70@1.75 |
| Barley | 1.30@1.38¾ |
| Oats white | 1.60@1.62½ |
| Oats gray | 2.00@2.10 |
| Rye new crop | 1.70@1.75 |
| Corn Egyptain | 1.60@1.65 |
| Cal sm round | 1.80@1.82½ |
| Alfalfa seed, Cal. | 16@18 |
| Mustard brown | 3¾@4½ |
| Millet | 2½@3 |
| Flaxseed | 4 |
| Broom corn seed per ton | 23.50 |

### Feed Stuff.

| | |
|---|---|
| Bran per ton | 29.00@30.00 |
| Feed cornmeal per ton | 39.00@40.00 |
| Cracked corn per ton | 40.00@41.00 |
| Rolled barley per ton | 31.00@32.00 |
| Rolled oats per ton | 40.00@41.00 |
| Oil cake per ton | 38.50@40.00 |
| Cocoanut cake per ton | 25.00 |
| Middlings | 36.00@37.50 |
| Mixed feed per ton | 25.00@30.00 |
| Shorts | 31.50@33.00 |

## Deciduous Market

SACRAMENTO, Aug. 28.

The California Fruit Distributors announced the fruit sales in Eastern markets today in carload consignments as follows: New York 60 cars, Distributors 37; Pittsburg 6, Distributors 3; Chicago 36; Distributors 16; Boston 13, Distributors 10; St. Louis 4; Distributors 4.

The average prices received in some of the Eastern markets today were as follows:

New York; Malagas, 95c; Elbertas, 70c; orange clings, 90c; seedless, 70c; Muir, 60c; Lovells, 60c; Tokays, $2; silvers, $1.15; eggs, $1.12; Bartletts, $3.15; Gros, $1.40.

Chicago; Bartletts, ripe, $2.50; green, $3.15; Malagas, $1; peaches, ripe, 35c to 80c.

Philadelphia; Lovells, 55c Malagas, 90c; Bartletts, 2.80; Tokays, $1.25.

Boston: Bartletts, $3.40; Malagas, $1.20; Gros, $1.70; Hungarians, $1.70; Germans, $1.20; Crawfords, $1; Lovells, 80s; Muir, 87c; Susquehanna, 87c; orange cling, 65c.

Salway peaches are starting now and by next week the shipments of this fruit will be well under way.

Tokays are moving Eastward quite rapidly, but the heaviest shipments will be next week when the grapes will be ready for large consignments.—Sacramento Bee.

## Citrus Market

LOS ANGELES, Sept, 1, 1909.

Valencias have advanced during the last week about ten cents a box. They have not as yet, however, come against the eastern supply of grapes and peaches which will be placed on the market during the next ten days. What effect this will have is not definitely known. The promise, however, is for fairly good returns for the remainder of the season.

The lemon market is in a somewhat easier condition than last week. The weather has materially modified and notwithstanding shipments have increased somewhat, there seems to be less of a desire to purchase. It cannot be said that there is any decline in prices, and in fact there may not be, though shrewd observers anticipate a slight lowering during the month of September from present indications. But even if this should be the case, if the precedent of former years is followed, October will see a recovery.

**Shipments.**

Total shipments to date since Nov.

1, 1908; 35,985 cars of citrus fruit. Of these 30,154 were oranges, 5,831 lemons.

NEW YORK, Aug. 30.—Twelve cars sold. Market strong and active, prices higher; weather cool, favorable.

## WHAT WE EAT.

The Hollander eats decayed sharks, but turns with disgust from bread and butter.

The Chinese are fond of stewed dog, but consider beef unhealthy.

The Turk deems dried grasshoppers a delicacy, but an oyster fills him with abhorrence.

The English eat periwinkles, a kind of sea snail, but will have none of the French escargot—a land snail fattened on vine leaves and strawberries.

The West Indian native adores a supper of baked snake and palm worms fried in their own fat, but the very thought of stewed rabbit makes him shudder.

The African bushman eats caterpillars, but scorns limburger cheese.

Savages eat all eggs, barring none. They eat lizards' eggs, alligator's eggs, turtles' eggs, ants' eggs, snakes' eggs. But savages consider crab meat unholy.

## ALMOST AS GOOD.

Little Ikey came up to his father with a very solemn face.

"Is it true, father," he asked, "that marriage is a failure?"

His father surveyed him thoughtfully for a moment.

"Well, Ikey," he finally replied, "if you get a rich wife it's almost as good as a failure."—Lippincott's.

# Business Notes

### GRIT.

The success of Mr. George H. Croley is due to a combination of three qualities—pluck, energy and courage.

At the time of the San Francisco fire Mr. Croley was conducting a large poultry food business. Being in line of the flames his place was reduced to ashes and he was forced to begin anew upon the foundation of unlimited credit and a reputation for fair dealing.

Starting in a small way, almost before the ashes had cooled, he has built up a larger business than before the disaster. The main office salesroom and yards at 631-637 Brannan Street occupy over 10,000 square feet and an adjoining warehouse contains an additional 11,000 feet.

Mr. Croley employs sixtxeen people and delivers on an average of a carload of supplies a day to his out-of-town customers, besides having an extensive city trade. A specialty with Mr. Croley is ground oyster shells and his machines are capable of producing a carload every day and a half. At the time of our visit there were eight carloads of charcoal on the road and ninety-five tons of grits in the warehouse.

A special feature of the new establishment is a complete laboratory wherein are determined the food values of various commodities. Mr. Croley is the northern California agent for the famous Lee preparatons and coast agent for the Sturtevant Company's line of Columbia veterinary and poultry remedies.

A new and complete catalogue is about to be issued and those desiring a copy should send in their names at once and the book will be forwarded as soon as it is is off the press.

### A BEAUTIFUL CATALOGUE.

If anyone contemplates the installation of a pumping plant in the near future, it will be most profitable to write to the A. T. Ames Manufacturing Co., at Niles, California for their Catalogue Number 24. This catalogue is full of information for the pump man, and accompanying it is a blank form of specifications and questions which may be filled out to get further information from competent engineers. The catahas 64 large pages and is profusely illustrated. It also has a number of tables showing capacity of cylinders, capacity of tanks, and other information of value to the irrigator.

In the introduction to the book we note: "With our long experience in building pumps, we are in a position to assist our customers in selecting the pump best adapted to any given service. Our shops at Niles are large and well equipped; our engineering department is prepared to furnish plans and specifications for complete plants, and to make special designs to suit any conditions. We invite inquiries and correspondence, and on receipt of the necessary data will promptly give information and quote prices."

In the matter of cup leathers for which this company is so justly famous, we quote from the booklet: "The successful operation of a Deep-Well Pump depends largely on the packing of the buckets, and cup leathers are the only form of packing that has proved satisfactory in continuous service.

"Good cup leathers will last a long time, sometmes for years, before wearing out. Inferior cup leathers give trouble from the start, cause a loss of efficiency, and waste power, time and money. Experienced pump men known this, and always specify Ames California Cup Leathers.

"The most essential thing in a cup leather is durability. It must often work under conditions that would ruin any other kind of packing, and must give the maximum service before being replaced. Generally the cost of a set of cups is very much less than the cost of labor necessary to pull the valves from the well and replace them, especially in deep wells.

"A good, durable cup leather must be made of proper material, must fit the cylinder just right, have the correct shape and thickness and a workmanlike finish. This requires experience, skill and proper facilities. If the material is not suitable it will not make a good cup, no matter how expensive a leather is used. Only a specialist can make good cup leathers."

## NEARLY SET THEM UP.

Two Irishmen were discussing the death of a friend. Said Pat: "Sure Casey was a good fellow." "He was that," replied Mike. "A good fellow, Casey."

"And a cheerful man was Casey," said Pat. "A cheerful man was Casey, the cheerfulest I ever knew," echoed Mike.

"Casey was a generous man, too," said Pat "Generous, you say? Well, I don't know so much about that. Did Casey ever buy you anything,"

"Well, nearly," replied Mike, scratching his head. "One day he came into Flaherty's barroom, where me and my friend were drinking, and he said to us: "Well, men, what are we going to have—rain or snow?" "

## THE LOWEST TERMS.

A man purchased some red flannel shirts, guaranteed neither to shrink nor fade. He reminded the clerk forcibly of that guarantee some weeks later. "Have you had any such difficulty with them?" the clerk asked.

"No," replied the customer; "only the other morning when I was dressing, my wife said to me, "John, when did you get that pink coral necklace?"—'Success."

60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

Write for Catalogue.

Have you heard of the Nix-Frost Crude Oil Gas Producer? It's "The Cheapest Power on Earth."

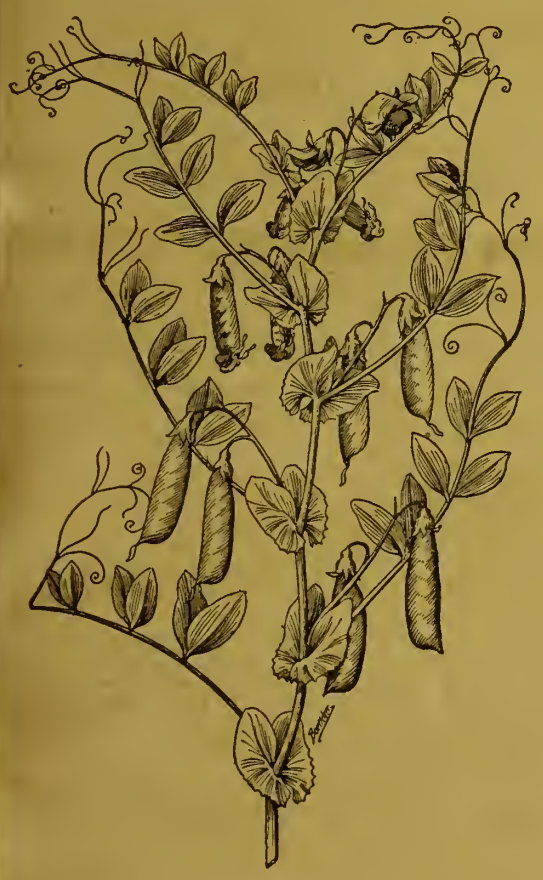
# Humus Secured from Green Manure Crops

## A Symposium. Methods of Planting and Plowing Under of Cover Crops, Written by Practical Workers in Various Parts of the State

THE MOST active and important of our plant foods is nitrogen, and to secure the fullest benefits from it, the soils must have abundance of humus and be in a mechanical condition which will admit air to all portions. Air is necessary for it permits of chemical changes which make the nitrogen which is in the form of organic compounds available. These changes are brought about largely through living organisms in the soil, and these organisms also cannot exist without air. Therefore, one of the principal questions confronting the soil tiller is that of the mechanical condition as well as actual chemical content which may he shown by an analysis. Of the two evils; a soil comparatively poor in the



Canada Peas.

elements necessary to sustain plant life but physically kept in good condition; and a soil rich in nutritive elements, hut in such physical condition that the roots are unahle to appropriate them, we would prefer the former.

Through years of experiment and ohservation, Californians have come to the definite conclusion that the one thing lacking in California soils is humus, and because of this lack a physical condition exists which makes it impossihle to get hest results from the soil. To secure humus, the addition of stable manure is perhaps the oldest method, hut for many years the planting of cover or green manuring crops has heen followed, and now more extensively than ever hefore. There is one peculiar effect of green manuring. Its results vary according to the original character of the soil. If sandy or gravelly, the soil is made darker in color and becomes more retentive of moisture. Clayey soils, on the other hand, are made more porous and friable and are less liahle to puddle or hake. They are also given hody so that they are less liable to erosion. Rich, loamy soils show less apparent effect than either of the others.

While this is proving so beneficial, growers have cast ahout to make it more so if possible and actually add fertilizing elements, or at least one element. This element is nitrogen which exists in abundance in the air. It has been proved that a certain kind of plants possess the power of absorhing this nitrogen from the atmosphere and making it availahle for the use of other plants. These plants helong to the leguminous family and comprise the clovers, alfalfas, peas, heans, vetches, lupines, and some others. The use of these plants in the southern part ot the state was so extensive last year that close to one hundred cars of seed were shipped from the Northwest. This seed was sown from the last ot August to the first of January. Generally its use has heen found beneficial, though sometimes it has been condemned. Therefore to get reliable information from those who have had actual experience, the Cultivator has sent to orchardists in various parts of the state, the following series of questions which has brought in the answers given on this and the following pages:

1. Do you grow green manure crops in your orchard or vineyard? What is the permanent crop?
2. What is the nature of your soil and sub-soil?
3. Do you prefer vetches, peas or lupines, or do you trust simply to the native growths? Wi you give reason for preference?
4. How many pounds of seed per acre do you sow, and do you broadcast or drill?
5. Do you use hone, superphosphates or other fertilizers to stimulate growth of green crops, and if so, do you drill in fertilizer prior to sowing seed?
6. Do you irrigate ground before seeding, and do you leave so it can be irrigated after crop comes up, or do you depend entirely upon rains?
7. What time do you plant?
8. Have you found the green crop to interfere with fruit gathering or other necessary winter opeations?
9. Do you plow under or cut up with disks, and how do you proceed to get completely under? What is condition of crop when you plow under?
10. After plowing do you harrow, or do you use any "Sub-surface packer" and is there any difficulty with pulling out before it is decayed?
11. Please give estimate of numher of tons of green stuff an ordinary season will give for turning under.
12. Since green manuring, have you noticed any gain in moisture holding capacity, less hardpan, or otherwise a better soil condition?

**Ben F. Thorpe, Covina, Los Angeles Co.**

In sending his answers to the questions, Mr. Thorpe of Covina writes: "I have been conducting a series of experiments under the direction of the Department of Agriculture in Washington, and have had some very interesting results. Have tried several new varieties of legumes, some of which give much hetter results than common vetch, hut they have not as yet been introduced long enough to place the seed on a commercial hasis, as present prices are prohihitive. Have grown both summer and winter crops on the same orchard with good results. I consider it highly important to get the crop planted early and plow or disk it under hefore Fehruary first, or before the trees begin to hlossom."

1. Have grown cover crops in my Valencia orange groves for seven years. Common vetch is my favorite.
2. Soil is light sandy loam.
3. I prefer vetches.
4. Drill in 60 pounds of seed per acre.
5. Drill in fertilizer first and then use hoth bone and superphosphates.
6. I irrigate hefore seeding and after crop comes up.
7. Plant September 1st.
8. Have not found that the green crop interfered with orchard operations.
9. I disk harrow when crop blossoms.
10. Have no difficulty with pulling out.
11. I estimate that an ordinary season will give about 20 to 30 tons.
12. The green manuring has given my land gain in moisture holding capacity, less hardpan, and better soil condition. Light soil is made heavier hy addition of humus and heavy soil is made lighter. By preventing land in orchard from washing during heavy rains it will repay hig interest on cost, to say nothing of value as fertilizer or improving mechanical condition of soil.

**A. E. Way, Fresno.**

1. I grow burr clover.

Soy Beans.

2. Soil is sandy loam with red hardpan.
3. I prefer hurr clover as it is a native clover, seldom needs inoculation and does not need as much moisture and warmth as peas and vetches. Indeed it seems to thrive even during the cold fogs we experience here sometimes in the winter.

# POTASH

Both Citrus and Deciduous Fruits exhaust the soil of plant food—especially **Potash.**

Restore the lost fertility by using a high grade fertilizer containing not less than 10% of **Potash**—and gather a full harvest of sound, fine-flavored fruit that will grade high and bring highest prices.

## Potash Pays

**See that your commercial fertilizer contains from 10 to 12 per cent. of POTASH.**

# Melilotus Clover

## the Great Cover Crop

For information and price, write

## GERMAIN SEED & PLANT CO., Los Angeles, Cal.

4. I find 15 pounds of recleaned seed sufficient. Have always broadcasted, but drilling would give better results. I have not sown any for the last two years as it reseeds itself from a ridge that I leave in the center of each row of vines, which of course is plowed up in the cross plowing.

5. I have never used any fertilizers to stimulate growth, but have every intention of using gypsum this winter.

6. Depend entirely on rains.

7. I plant as early as possible in autumn, so as to get first rainfall.

8. No. I have not found it to interfere with orchard work.

9. Always plow under, using a rolling coulter. I try to plow under when clover is in succulent stage, as it decays more quickly. Have used disk to chop up clover but found growtn too dense to permit of this.

10. Harrow directly after plowing under, harrowing the same way as I have plowed, which completely covers any clover that might be above ground. I always allow a fortnight's interval before cross plowing. This of course can only be carried out on a small acreage.

11. Do not know as to tonnage, except that I try to cover every inch of ground with clover.

12. Burr clover being shallow rooted cannot affect hardpan. Soil condition is decidedly better, easier to work and keeps in good tilth, vines are healthier, canes thicker, foliage a darker green and yield of grapes is larger.

I intend this autumn to sow alfalfa in the wide rows (12 feet) of the vineyard, that is, if I can possibly get a mower that will cut a strip of three to four feet wide directly before or behind the team, in which case I believe it will be the best green manure crop to grow. I have seen the results of alfalfa in orchards and am very anxious to try it in the vineyard.

**C. C. Teague, Santa Paula, Ventura Co.**

1. We have been growing green manure crops in our lemon and walnut groves for about five years.

2. We have all kinds of soil. More of a clay loam nature than any other.

3. We have used fenugreek principally and have obtained good results from that—better than from anything we have tried. We have tried vetches, beans, lupines, but did not succeed in getting as good tonnage of green stuff as from fenugreek.

4. We have been putting on from 15 to 20 pounds seed to the acre. We drill the seed in lemon groves, but broadcast it in walnut groves. We have obtained good results both ways but consider drilling best.

5. Have been using complete fertilizer and have been drilling in 10 pounds to the tree prior to planting of cover crop.

6. In the lemon groves we irrigate the ground just before seeding, but in the walnut groves we seed immediately following the harvesting of the nuts, and without rirrigation, in both cases harrowing the ground before seeding, so that the crop can be irrigated in case of short rainfall.

7. During the month of Sept.

8. No. Have found it to be an advantage, as it prevents the washing of ground by heavy winter rains, and saves cultivation during the winter months.

9. Plow with disks, and in case of very heavy crops, run an ordinary spike-tooth harrow ahead of disk. Delay time of plowing as late as possible and still make sure of getting ground is good condition before rainy season is over, regardless of condition of the crop.

10. After plowing, use disk harrows getting the surface into good mechanical condition and to avoid pulling green stuff on top before it is decayed.

11. Weighed what we considered average yield in our walnut groves last year and it weighed 18 tons of green stuff to the acre.

12. The mechanical condition of our soils has improved constantly since beginning to grow cover crops. Land that was before refractory, and very difficult to work, has become pliable and can be handled with more ease, and holds the water better and in every respect is greatly improved.

**J. W. Mills, Marysville Yuba County.**

This most valuable adjunct to horticulture has been almost entirely left to nature in the Sacramento Val-

Cow Peas.

ley. In fact artificial fertilizing of every description has been neglected. There are a few instances where commercial fertilizers have been used, but under very unfavorable circumstances which in the past season could not possibly show their worth.

Without irrigation facilities with which to control the moisture conditions, fertlizing of any description is sure to give uncertain results. For this reason, this part of horticulture has not met with encouraging result in the greater part of the Sacramento Valley. Last spring, for instance, was exceedingly dry, there being no rain from early in March to the present time. Under such conditions, green manuring, or fertilizing the soil in any way, would give negative results, no matter how well it was done, provided there were no means of applying sufficient moisture to make the material available. In the case of green manuring, little or no crop was possible, except on naturally moist land.

On moist land, the vetch that is so extensively used in Southern California, does exceedingly well. Land that was flooded for a period of two weeks in January, grew a volunteer crop of vetch—waist high, which was highly prized as hay for dairy stock.

When it is remembered that fruit growers were hard pressed last spring to get their ground broken up under natural conditions, it will be readily seen that a green manuring crop would have been a detriment. Only where irrigation is possible, is it advisable to grow green manuring crops unless they are on land that can be worked within a few days after a heavy rain fall. Northern California is in no way ahead of the south in this case.

Crops that have come under my observation show that vetch is the most desirable. It should be sown in the dry ground where possible so as to come up with the first rains. Inoculation is not necessary, but desirable. We planted inoculated seed and some that was not inoculated and found nodules on the plants from both. When sown in dry ground, there would perhaps not be as effective or complete inoculation as when sown in moist soil. Our soils grow so many varieties of legumes that very few will not become inoculated through the soil.

**Geo. C. Roeding, Fresno.**

My experience with green manure

Hairy Vetch.

crops in this locality has not been entirely satisfactory with either vetches or peas and in the future my experiments will be along other lines.

I tried Canadian Field Peas in an orange orchard at Exeter in which the soil was of a heavy, black, adobe nature and instead of the trees being benefited by the application of the peas, they seemed to show a setback and it took several years before we could get the trees back to a thrifty condition. It may be possible that the peas were sowed too late in the season. They were not planted until in November and were not plowed under until they became rather dry so it is quite possible that this may have had something to do with their not giving more satisfactory results. This experiment was made in the foothill lands of Tulare county.

I have tried them on sandy soils in my orchards at Fresno. I have found, however, that unless irrigating water is available in October, which seems to be the most satisfactory month to put these peas in, so as to moisten up the ground before planting, that they will not start. To wait until the winter rains commence, which in many years in this locality do not begin until November and even later, makes the season in which they should make their growth so short that they do not become sufficiently advanced to accomplish the purpose for which they are put in. I would not advise orchardists to attempt the planting of these peas, unless they can arrange to secure water for irrigating purposes in the fall of the year, for without this the results will simply be nil.

I have tried Black Eyed beans on one or two of my nurseries, sowing them broadcast, with a view of stimulating the soil in which several crops of nursery stock had been growing. These beans were planted in April and in order to keep them in good growing condition, it was necessary to keep the ground well irrigated. Such irrigations could not be followed up by cultivation and although, the beans were turned in before they were fully ripe and after the ground had been irrigated, our experience with them was such that this plan of green manuring the ground will not be followed in the future.

I planted a lot of cuttings on ground treated in this way last year and it remains rather cloddy and has the appearance of land which was plowed too wet after a heavy rain. I attribute this condition to the fact of the constant irrigation without following it up with cultivation. The cuttings on this ground are not growing in the manner they should considering the amount of green material that was turned under.

My experiment next winter will be to plant barley and rye in both orchard and nursery ground as this will sprout and grow without irrigation and I expect to turn it under when it is a couple of feet high. The ground would be plowed during the latter part of January or early February and from my observation of the use of such crops on land in other localities, I am quite sure that I will secure more satisfactory results than by the use of vetches or peas.

**A. N. Judd, Watsonville, Santa Cruz, Co.**

The most exasperating problem the horticulturist has to contend with is that of fertilizing. I wish there could be some hard and fast rule given, even in cases where soil conditions are known, which would stop this everlasting groping in the dark, but nature often steps in and blasts hopes that seem to be almost realized, and then we go off on another tangent and waste more money, seeming to forget the lessons of the forests—Mulch! Humus! Mulch! Humus!

Of all the nitrogen gathering plants I would prefer alfalfa. It is the deepest rooted plant we have, offering a conduit for the lowest roots of our orchard trees. It is also one of the best for extracting nitrogen from the air. It should be cut as often as half grown (so that the first cuttings will rot before the next and not interfere with the knife), except the last cutting which should be made when the plants are in full bloom, as it will have all winter to decay. The stubble will also hold the leaves of the trees, thereby saving a much valued humus.

Perhaps the analysis of alfalfa would convey a more tangible idea of its value as a fertilizer. Accordingly, I apend the following from our government reports: "A ton of alfalfa hay contains 44 pounds of nitrogen,

8.27 pounds of phosphoric acid, 50.95 pounds of potash, and 40 pounds of lime." Being a leguminous plant you can easily understand the roots are covered with nitrogen gathering nodules that are not taken into account in the above analysis.

If you insist on a cover crop, try planting two rows each of horse beans (20 pounds per acre), vetch, and alfalfa, leaving space equal to two rows between the plantings. It is only by comparison that we learn the quickest and most economical as well as practical way to fertilize. The horse bean planted as soon as the seed will sprout in the fall will give the greatest tonnage to plow under in early spring. Like other legumes it should be plowed under while half in pod and half in blossom. Of all fertilizers give me alfalfa. It gives results, a hard thing to get any other way.

**W. E. Sprott, Portersville, Tulare Co.**

1. I generally grow Canadian peas

Tangier Peas.

as green manure crop. Burr clover volunteers in my orchard.

2. My soil is decomposed granite and heavy clay; sub-soil mostly soft granite.

3. Have no choice between peas and burr clover, but sow peas for enrichment.

4. I broadcast 30 pounds of seed to the acre and plow in about three inches.

5. I use bone fertilizers on the green crop and plow under with the peas.

6. I irrigate before seeding and leave furrows for later irrigating.

7. Plant about the middle of September.

8. Have not found green crop to interfere with necessary orchard operations.

9. Plow under with disks at first bloom if possible.

10. I harrow after plowing. If disk plow is used there is no danger of pulling out.

11. Have not estimated tonnage.

12. I find that my land holds moisture better and pulverizes finer since green manuring.

**W. H. Schureman, North Pomona, Los Angeles County.**

1. I grow green manure crops in my orange orchards.

2. Soil and sub-soil are gravelly and sandy loam.

3. I prefer vetches as they will stand more grief, and have a better root system.

4. I broadcast 60 pounds to the acre.

5. I have not used fertilizers to stimulate growth of green manure crop.

6. I irrigate before seeding; then furrow out immediately for future irrigation.

7. I plant the first part of October.

8. The green crop does not interfere seriously with the fruit gathering, but it is a little wet for the pickers some mornings.

9. I plow under with a disk plow which covers well. The crop is green when plowed under.

10. After plowing I harrow smoothly. The vetch will soon rot if the ground is moist.

11. I estimate 20 to 25 tons per acre of green manure stuff.

12. There is a decided gain in moisture holding capacity, the ground keeps mellow and is full of humus.

**Mrs. M. E. Sherman, Fresno.**

1. We grow green manure crops mostly in the orchards. Those planted vary from Canada field pea and burr clover for winter use, to cow pea and horse beans in the summer. We have not used vetch or fenugreek.

2. Heavy red soil inclined to run together and break up in clods. Hard pan from three to ten feet below the surface. The greater portion of the land is sub-irrigated from the large creek in the center of the place that now carries the water of the canal company.

3. Prefer peas and burr clover. Burr clover in the vineyards will self sow if given any chance whatever to do so. If the first plowing is held back until the third week in February it is certain to produce a liberal amount of seed for next year's crop. Peas we have planted with a one horse drill, one or two rows between each two rows of vines in latter part of August or just before the vintage. The first rain starts them to growing and often before Christmas they are visible all over the vineyards. We have broadcasted the peas but the catch was not as good as when we drilled them. Many years in the San Joaquin valley there is little growth made before the time comes when they must be turned under. The rains must come early and the weather be not too cold to secure a heavy growth. The heavy natural growth of yellow top and burr clover gives good results. Alfilaria patches seem to have little effect on the soil even though very dense when turned under.

4. Drilling one row of peas between each two rows of vines takes twenty pounds to the acre. When broadcasted fifty is not too much. Burr clover we broadcast every tenth row of vines and expect it to seed itself after a few years, all over the land.

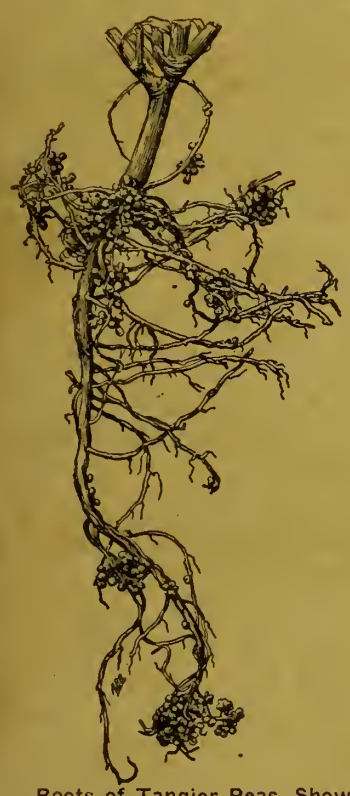
5. No fertilizers are put in with the cover crop. After the first plowing, if needed, bone meal is drilled in and then at last cultivation nitrate of soda is added to the soil.

6. In sowing cow peas in the orange trees in April the ground is moist enough, either from natural rain or from irrigation, to sprout the peas. Later irrigation is applied as needed.

7. We plant in August in the vineyard; in April in the orchards.

8. The green crop does not interfere, but it must go under at the right time to get the cultivation done. If the crop fails to grow fast enough to be a success one year, we hope it will be better the next year. In the vineyards peas do not come on fast enough most years to make it profitable, for they rarely reach the blossom before the time comes to turn them under. Burr clover and sweet clover are usually in bloom, while lower portions have already a few ripened seeds.

9. If the crop is green, it cuts up readily with disks. Then it is turned under with the ordinary plows. Sometimes, however, we use a chain to drag it in better. The peas are easily covered as they chop up readily into small pieces when disked with the disks set on a good slant. The only thing that prevents a cover crop from going under easily is having it too dry. If it is too dry, a little water on the land will make it rot rapidly after it has been covered. If the crop has been allowed to grow



Roots of Tangier Peas, Showing Characteristic Nodules.

too long, I should make arrangements either to water before turning it under or just after it was turned down. If soil conditions of moisture are right and the cover crop green enough, it will turn under completely and in five days afterward should have softened enough to be safe from dragging out when cross plowed.

10. The plow covers the crop enough with us but if it did not I should try using a smoothing board behind the plow, set so that it would shove the high portions of the earth ahead and fill up the holes and depressions.

11. I could not give any idea as to weight as we have never cut it to weigh it and guesses are not accurate enough to make it worth while.

12. The moisture holding capacity is greatly increased. The water used by plants is not drunk up as an animal fills itself with water, but is taken from the particles of soil that it coats as a thin film. Now by adding vegetable matter or humus we make the soil hold itself apart in small particles, each coated with its water film, in the best state for the plant to absorb the moisture and the organic matter held in it. Where a crop of weeds, barley, or grass is plowed under in the spring, year after year, the soil becomes more and more retentive of moisture. We have a vineyard running up to the line of an adjoining place. Both pieces happened to be planted the same year. On our side manure has been spread year after year and then plowed under. On the other piece no manure has been used. Our side is heavy with green growth every spring, often enough to pasture the cows, while the other side remains naked. This time of the year the moisture remains near the top of the manured piece while on the other the vines look parched.

Hardpan in Fresno county is not plowsole made by poor cultivation but a hard formation that holds the irrigation water and is found at places only a few inches below the surface, while in others it is ten feet. Where this hardpan is too near the surface, it has to be blasted out, as nothing, not even a plow can go through it. Now plowsole is prevented largely by use of cover crops as the penetration of the roots alone will help. The turned under green stuff acts like a poultice to moisten it up, but with plenty of humus in the soil it will not form at all. Green manure helps the soil constantly, while the continued use of commercial fertilizers leaves the soil dry and lifeless. The latter may contain the elements of plant food, but owing to lack of water-film the plants cannot as readily take up the food.

# Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## THE CALVES.

By Mrs M. E. Sherman.

WHERE the calf is left to nurse the cow for a couple of days there is rarely any trouble from milk fever. The calf only takes a portion of the milk each time and the udder is not chilled by its emptied condition. Sometimes the calf favors certain quarters of the udder and neglects the other portions, causing garget. If it is decided to leave the calf with the cow for the first three days, see that the udder is evenly relieved of its milk. We do not leave the calves with the cows but are careful that all the milk is not removed for the first forty-eight hours. Use a light blanket over the cow after calving if the weather is chilly. Now unless the barn is kept in the pink of perfection of cleanliness and disinfection, it is safer to allow the cow to drop the calf in the alfalfa field. She should be watched carefully but not disturbed by meddling unless necessity arises. If a cow has happened to drop her calf in a dirty place it is well to wash the udder before allowing the calf to nurse. A quart of warm water with a teaspoon of creolin in it will remove any bacteria that may be there.

Calf Cholera.

Where the calves are taken with scours when only a few days old, one cause is often found in their poorly nourished condition when dropped. The young calf carries on its first days of living on the stored up fats of its body. When these are reduced to almost nothing, the start must come from the food taken in at once. The little stomach is as weak as the rest of its body and rebels. Now when calf cholera attacks the pen the proper way to stamp it out is to remove all cows that are springing away from where the cows have been dropping their calves. Put then on fresh ground and in new corrals. Begin at once to feed them grain and plenty of good hay. See that they have no decaying or soured stuffs to eat. When the calf is dropped, bathe the navel cord with a solution of corrosive sublimate 1-500 parts. Put this on the cord twice a day until it dries up. Keep the calves that are not affected out of the pens of the sick ones, leaving the sick ones where they are so that no more land is infected with their droppings. The pens should be sprayed with a good disinfectant and the side walls whitewashed. The best of disinfectants that are not poisonous and that are cheap are the various forms of coal oil preparations offered for sale under different trade names.

Paint.

The wood of the house and the mangers may be soaked with oil of creosote. This will prevent them absorbing much foul matter. The pig pens, stables and fences are readily made to look well by using a paint made from crude oil. We are using it now on the roofs and sides of buildings on the ranch. One gallon of crude oil, heavy oil, colored with three pounds of Venetian or iron red, thinned to spread well with engine distillate. It only costs a few cents a gallon and preserves the roofs and buildings perfectly There are a number of the dry mineral colors that can be used if other colors are desired. Crude oil makes a good inside paint for the chicken house, as it is slow in drying and kills off lice and ticks. The dull red stain is pleasing to the eye, for in California the brightness of the sunshine is often too dazzling when it falls on whitewash. We forget in painting the houses how chary Nature is in the use of clear white, and results are more pleasing when we modify the tones as she does. The white homestead that we read of in the loving description of the wanderers from home, belongs to another climate, where the clouds drift and throw gray shadows over the whiteness of the buildings. This same red stain is good for the inside of the ranch buildings but I rather prefer to have them whitewashed as it makes the interiors lighter.

## THE EFFECT OF RUST ON MILK.

Experiments have repeatedly shown that both tin and iron have a prejudicial influence on rennet action. This suggested the desirability of determining whether or not rusty cans have a similar influence. Part of a sample of milk was placed in a rusty tin pan (with about fifteen rust spots in the bottom of the pan) and the remainder was kept in a Jena glass vessel (breaker) for comparative purposes. The milk kept in the rusty pan gave evidence of a retarding influence on the rennet action as compared with that kept in glass beaker. It required from one to sixteen and one-half minutes longer for the same milk kept in the rusty pan to coagulate than in case of the milk kept in the glass beaker." Wherever there was a retarding influence on the rennet action there was also a retardation of the acid development as well, but the latter was not sufficient to account for the delay in rennet action.

Milk which had been allowed to stand in iron dishes for several hours had a peculiar bluish gray color, indicating the presence of iron in solution. In several instances the amount of iron dissolved in the milk was determined as iron oxid. The maximum quantities of iron dissolved in the milk ranged from 1 to 1½ pounds for every 1,000 pounds of milk. The lower acidity of the milk kept in contact with iron also supports the view that the acid of the milk acts upon the iron and finally causes it to pass into solution (retarding rennet action.)

Milk comes in contact with iron in the form of rusty cans or poorly tinned utensils in practically all creameries and cheese factories. The quality of the milk will to a large extent depend upon the condition of utensils in which the milk is poured, kept, and finally hauled to the factory. The degree of influence of iron on milk will depend largely upon the temperature of the milk, the length of time

kept in the cans, and the amount of exposed surface.

**Conditions in north European dairy countries.**

In progressive dairy countries of northern Europe the quality of dairy products manufactured is generally uniform, and every precaution is taken to maintain a uniform product. Cleanliess is generally practiced at both the farm and factory. The utensils used are of superior quality, and naturally there is no occasion to consider this problem seriously. As a rule, the European utensils are stronger; the cans, for example, are of heavy steel and well tinned. Experience shows that these heavy cans are the most economical in the long run, and there is less danger of denting in or wearing off the tin.

**Conditions in America.**

It is not necessary to describe here the American milk can, and especially the cheaper ones; if not the first time, surely the second or third time these cans are used one will find places where they have been dented in. As the number of indentations increases the tin begins to crack, leaving fissures or inroads for milk and water and acid. Often this thin layer of tin does not cover all of the iron, thus leaving microscopically small surfaces of iron exposed, which also become the sources of damage by water and acid. Under such conditions the tin peels or falls off, and it is then only a short time before the cans become unfit for use.

**To Remember.**

The attention of the milk producer and the factory operator is called especially to the following points:

(1) A better grade of utensils should be used in the handling of milk and its products. The iron or steel plate should be heavier and more thickly coated with tin.

(2) No milk should be accepted at a factory which has been kept in iron exposed pails or cans.

(3) The factory or creamery should be an example of neatness and cleanliness, with all utensils in first-class condition.

(4) Co-operation among the proprietors of creameries, cheese factories, and city milk supplies will tend to bring about cleanliness among patrons and the use of better utensils.

(5) Milk should be bought on its merits, by some satisfactory arrangement following well-founded sanitary and hygienic rules, by which the production of milk of superior quality is encouraged and milk of low grade either rejected or gradually improved.

## BLOAT.

When your hungry cattle and sheep get into alfalfa or rape for the first time you may have some losses unless you take certain precautions. Even when precautions to prevent are strictly observed some animals will bloat, being out of condition when they go in the field.

The common practice of letting the stock to clover, alfalfa, or rape gradually is this: give them a good fill in the morning on grass or other feed and when the dew is off and they seem ready to lie down, admit them to the clover for an hour. Next day repeat but increase the time. Each day increase the time in clover until it is safe to allow them in all the time. Some do this but a day and then let the cattle or sheep remain day and night in the clover while others always prefer to keep them out until the dew is off.

There may be unnecessary precautions in this, but for pure-bred stock pastured where no one can keep an eye on them it may be worth while. But with the best of care they are apt to bloat. Then what? Quickly get a long necked bottle, put in two tablespoons of turpentine and fill with warm water. Drench the bloated cow with this and in a few minutes she will be all right. Another just as good is a quart of raw linseed oil given in same manner.

For sheep a half teaspoon of turpentine in a pint of water or a half pint of raw linseed oil as drench. Or, put a rope in the mouth and tie over top of head so as to hold head back and mouth open.

At this season you better stock up with either raw linseed oil or turpentine—or both—and instruct every member of the family how to give the dose.

The way to drench with long necked bottle is to hold the head up a little—not much—and insert neck of bottle in the cheek back of the molars. Pour and give animal chance to swallow or you will strangle it.—Farmers Tribune.

## TRAINING THE COLT.

The time to begin education is almost from his birth. Begin then to handle him gently; pat him, rub his head and neck, handle his legs and feet, open his mouth, etc., and accompany this with kind words and perhaps some sugar or other choice morsels. Put a halter on him before he is strong enough to make a strenuous struggle to get away and lead him about within sight of the dam, until he will be willing to go whereever led. Before he is weaned he may be accustomed to the bit by having a stick put in his mouth and held in place by strings. Then use the bit and bridle and teach him to lead by that and to be guided by it. Do all this without blows or loud talk.

Some would hitch up the colt with an old steady horse, driving him in in double harness first, but I should prefer giving his first lesson alone, and afterwards teach him to work or drive with a mate. Teach him to walk first. Trotting or running fast will come to him by nature if they are to come at all. See that all harness put on him fits him well enough not to chafe or hurt him anywhere and never overload him by driving too far or too fast. Many balky or vicious horses are made so by rebelling against tasks that they think are too severe. Do not punish for a little playfulness or coltishness, but restrain him quietly as soon as possible and let him know that he can best work off his superflous energy by doing that which you want him to do. This may not alwys be done without a little corporal punishment, perhaps, but it would be better if it could. Accustom him to automobiles, trolley cars, steam rollers and other objects that seem strange to him by leading him up to them when not in motion; let him see them and smell them and soon he will not be frightened if they move.

A horse so trained may be driven short distances in a light carriage befor he is 2 years oid, if the driver is not too heavy, and at 3 years old may begin to do considerable work and will be easily worth much more than one that is untrained or improperly trained. There is a chance that by that time he will have become so much of a pet and a family favorite that it will seem almost as hard to part with him as with one of the family, but who has a better right to keep a well trained family horse than the man who has raised him, made him what he is and taught him what he knows.—Rural Life.

## "DON'T GIVE MEDICINE."

Frequently when we sell a Jersey cow to a person who has never owned one before, we are met with the inquiry, "what shall we do if she gets sick?" Our usual answer is, "do nothing." Fully ten Jersey cows are doctored to death to every one that dies of disease. On our farm we rarely give a dose of medicine and out of nearly five hundred cattle only one died last year (1908) of disease, and that disease was blood-poisoning. About the only medicine we ever give is ordinary Epsom salts. If a cow has from over-eating or in any other way gotten her stomach out of order, take a pound and a half of salts and an ounce and a half of ground ginger; dissolve in about a quart of boiling water and when the mixture is lukewarm, put it in a bottle and pour it down her throat. This will usually produce a free movement of the bowels and give prompt relief. If it does not, repeat the dose in twelve hours. When the bowels move freely, nature will usually complete the cure.

Feed your cow regularly, but do not over-feed her. Feed her on such feeds as are usually fed to cattle. Do not experiment by stuffing her with strange feeds, simply because you have been told that some one else did so. Good hay, cottonseed hulls, wheat bran and corn meal are the staple and tested feeds in this country. If you feed cottonseed meal do not feed over a quart per cow per day, and when you begin to feed either cottonseed meal or hulls, feed only small quantities until your cow becomes accustomed to it. Rice bran is also a good feed, or rather it will be, when the rice men learn that it will be to their interest to put up pure rice bran without mixing it with rice hulls or other dangerous substances. Do not feed molasses, turnips, slops or potatoes, and feed all cows very lightly for a week before calving. Under fair and ordinary treatment Jersey cows should live to an average of 15 years. We have many strong, active cows that are above that age.

As an illustration of the way some people treat Jerseys we give a letter which we received a few years ago from an apparently sensible man. It reads as follows:

"Gentlemen:—The calf which I bought of you three months ago has always been very playful until yesterday morning he seemed a little stupid, but I did not think he was sick. We gave him a quart of molasses and a pint of lard, but he did not seem to improve and would not eat his feed. I then boiled two plugs of tobacco and drenched him with the water, and an hour later gave him a pint of powdered coal soaked in spirits of camphor. He seemed to grow worse and my brother came over, and on his advice I gave the calf a pint of kerosene mixed with a pint of melted vaseline. It died soon afterwards and almost without a struggle, and I can't imagine what killed it. Do you think it was tuberculosis or Texas fever? I may buy another one soon, but it seems I have hard luck. Your friend, J. C. B."—Jersey Bulletin.

F. M. Sumpter, of Sumner county, Kansas, tells the author he raises and markets 500 to 600 hogs annually. These are grown principally in his abundant alfalfa pastures, with perhaps an average of an ear of corn per day until their six weeks fattening is begun, when they are heavily fed with corn. The unqiue circumstance in connection with his successful operations is that he does not stock his pastures heavily enough to prevent harvesting from them three cuttings of hay each season, averaging a ton per cutting. The advantage he claims for this is that the hogs have continuously a fresh, tender growth to graze on instead of the coarse, woody stems they would have before them if no mowing was done, while the hay secured is as valuable as the same quantity from meadows not used as pasture.—From Coburn's Swine in America.

Of the various mammals whose milk is used for food in different parts of the world may be mentioned the goat in the hilly districts of Europe, the buffalo in India, the llama in South America, the camel in desert countries, and the mare on the steppes of Russia and Central Asia. Sheep's milk is used in some countries for making cheese and in other ways, and the milk of reindeers is commonly used as food in the arctic regions.

Which of these women is you?

One has consented to use a disk filled "bucket bowl" cream separator, and will spend **twenty minutes** twice a day washing the 40 to 60 disks it contains, as shown in the right hand pan.

One has insisted on having a simple, sanitary Sharples Dairy Tubular and will spend only **twenty seconds** twice a day washing the tiny piece in the left hand pan—the only piece Dairy Tubular bowls contain.

Be the left hand woman. Insist on a Tubular.

## GREEN MANURE CROPS.

(Continued from Page 247.)

Commercial fertilizers give better results in moist soils than they do in arid regions. There green manuring or cover crops never render the soil too acid but retain and conserve the scanty rainfall.

**Charles C. Chapman, Fullterton, Orange County.**

For several years I have grown green manure crops, preferring vetch; at least have used this with satisfactory success. My soil runs from a sandy loam to a heavy, cold soil.

I prefer the vetches to any other I have experimented with for the reason that I seem to get a heavier growth from these than any other, and that is what I am after.

I usually drill about forty to sixty pounds to the acre in the orange orchard. Preceding the sowing I have drilled a small amount of tankage, doing this more to assist the growth of the vetch than anything else.

I have irrigated thoroughly before seeding and leave the ground in condition to irrigate afterwards if necessary. I plant as early as I can which is usually in November. I think, however, it would be better if it could be put in thirty to sixty days earlier.

I have never found the green crop to interfere with gathering the fruit. I have usually plowed under the green crop with disk plows. With these it can be done very effectively. We make no further treatment of this soil for sometime after plowing, frequently having rain to assist in the process of decay. I presume we grow from ten to fifteen tons per acre. I think the green manure is helpful in holding moisture, and in general puts the soil in better condition.

**Roland S. Vaile, Claremont, Los Angeles County.**

1. We have grown green manure cover crops between our orange trees one way for the past three years, and will plant again next fall.

2. Our soil is largely a heavy loam, with traces of both clay and gravel. The sub-soil is similar to the surface.

3. We prefer vetches, because we have found better nitrogen nodules on the roots, because they plow under better, and because they rot quicker, according to our investigations.

4. We sow 40 or 50 pounds to the acre. Have sown both ways, and if the work is well done can see very little preference for either method.

5. The past two years we have drilled in a complete fertilizer some two weeks before sowing seed, as additional food for the trees as well as a stimulant for the cover crop. We drill early so that it may be largely dissolved before seeding. Undissolved fertilizer has a tendency to rot the seed.

6. We always irrigate the ground thoroughly before sowing, and plant while soil is still moist. We irrigate two weeks after planting with very small streams and then once a month until the regular rains.

7. We plant about the middle of September; this year it will be just as soon as the fumigators can get through.

8. Cover crops are of no great hindrance in an orange orchard; in fact they save the work of cultivating after the rains. It is a little hard to watch for gophers, but when the crop is planted only one way that difficulty is largely done away with.

9. We have found it best to disk first and then plow the crop under. The vetch is usually about a foot high and somewhat spreading when we plow. We do this sometime early in February.

10. After plowing we use a harrow to smooth the ground. Then after a few weeks it will cultivate without pulling out.

12. The physical condition of our soil has been greatly improved by green manuring. The clay has become more porous, the gravel retains moisture better, and the pure loam is easier to keep soft and mellow for a considerable depth.

We expect to put alfalfa in a young orchard this fall and leave it for two or three years. We hope in this way to get good results, to keep an all year crop while the trees are small, and get one or more cuttings of alfalfa each season.

**E. L. Dreher, Pomona, Los Angeles County.**

1. I grow green manure crops in my orange orchard.

2. The soil is gravelly loam.

3. Prefer use of vetches. Have never tried lupines but have used the field peas. Vetches have finer growth and root system and more solid substance than the field pea which makes rank growth containing much water. The peas will die when driven or trampled on; the vetches will not.

4. Sow broadcast with drill 50 to 60 pounds to the acre.

5. Have used bone meal but could see no effect.

6. Irrigate and cultivate thoroughly before sowing. Furrow out immediately after sowing and irrigate every two weeks until sufficient rain.

7. Plant in September.

8. Green crop does not interfere with orchard work.

9. Do not plow. Cut with disk four ways waiting three or four days between each disking so as to give time for that which is cut off and exposed to partially dry, and that which is covered to partially rot. Do not get the cover crop under but pulverize it with the soil. Disk the latter part of February and March and do not go by the condition of the cover crop but by condition of moisture in the soil.

10. Do not plow.

11. Have not estimated tonnage.

12. To the last question I would say emphatically, yes; especially in improved mechanical condition of soil. I have no hardpan.

Last year the U. S. Agricultural Department sent me 18 pounds of Tangier peas which I sowed and consider far ahead of the vetches. It makes a heavier growth of both top and root and has larger nodules than the vetch. Otherwise resembles vetch closely.

**John Burr, San Fernando.**

1. I grow green manure crops in my orange and lemon orchards.

2. Alluvial soil washed down from the mountains. No hardpan.

3. Have tried peas, but prefer vetch as it forms better sod and decomposes more rapidly.

4. Broadcast about 35 pounds per acre.

5. I scatter fertilizer and plow in with vetch, then about June scatter again about five pounds per tree with about two pounds of nitrate of soda.

6. I irrigate before sowing and after covering. I make about six light furrows so that if necessary it

can be irrigated if it doesn't rain.

7. Plant in September.

8. Green crop does not interfere with orchard work.

9. Turn under about the first of February. If very rank I disk before plowing, if not, plow under from four to five inches.

10. After plowing, I disk to cut up and pack it.

11. I have never estimated crop, but it makes a nice sod.

12. There is no question in my mind but it improves the condition of the soil, retains more moisture and is an advantage in tree growth.

**O. S. Jewett, Lordsburg, Los Angeles County.**

1. I use green manure crops in my orchards.

2. Soil is heavy; 12 feet to close clay.

3. Prefer vetches. They plow under easiest and decay soonest.

4. I use 45 pounds of seed to orchard acre, and consider drilling preferable as it covers all the seed.

5. I do not use fertilizers for the green manure crop.

6 and 7. I sow the seed after a September irrigation, then leave ground level as furrows carry off too much winter water.

8. The green crop is sometimes damp for fruit pickers.

9. The disk plow puts it completely under.

10. I harrow to pack it down so it will decay.

11. Have never weighed and estimated tonnage.

12. By green manure crops soil conditions are much improved. There is no question but that the ground will hold moisture much longer.

**B. E. Hutchinson, Fowler, Fresno County.**

We cannot grow green manure crops here as we cannot get water after September 1st and the rains come late. We use all kinds of fertilizers. Green stable manure is best for our sandy loam land. I am sorry I cannot raise something to make more humus and save the expense of fertilizers. I am a great friend of cover crops, but cannot benefit by their use until I put in pumping plants.

**V. V. Le Roy, Claremont, Los Angeles County.**

1. I have grown vetch in my orange orchard for six years and peas for two years.

2. Soil is sandy loam with gravel sub-soil.

3. I prefer vetch, because it gives a better cover, stands dry weather and cold weather better than peas and also stands wear and tear better. Peas cannot be walked or driven over, but vetch can to a limited extent. It is also much easier to get under in the spring. I allow all native burr clover to grow.

4. I drill in 40 to 60 pounds of seed per acre, according to space between the trees.

5. I use steamed bone meal, drilled in just before the vetch seed is drilled. The one and a half per cent nitrogen helps the vetch to start well, and the phosphoric acid is in the soil ready for the growth of the trees.

6. I irrigate just before seeding and leave shallow furrows for irrigation if needed.

7. I plant early in September.

8. The manure crop does not interfere with orchard work.

9. I use a disk plow as it turns crop completely under. I plow under when the vetch has formed a mat a foot or more deep.

10. I use a disk harrow or a leveler and plow the other way in about two weeks. The vetch rots thoroughly, so that there is nothing to plow up.

11. Have not estimated tonnage. Vetch gives as good a crop as alfalfa on the same surface.

12. This leaves the soil in much better mechanical condition. There is no hardpan and soil holds water well. There are many advantages in a cover crop besides the value as a fertilizer and for humus. When cover crops are not used, the constant cultivation necessary not only means work and expense, but stimulates the growth of the trees when it would be better for them to be dormant, and causes the fruit to ripen and fall much earlier. The cover crop also holds the winter rain on the place and allows no washing. The roots form good channels for the rain to penetrate deeper into the soil. In short, there are so many advantages in a cover crop that it is hard to understand why everybody don't have them.

**E. L. Koethen, Riverside, Riverside County.**

1. I grow green manure crops in my orange orchards.

2. Soil is heavy adobe derived from granite.

3. For shady orchards, large seedlings for instance, I prefer vetches. Even here in order to get satisfactory results, the seed must be sown early, as early as the last week in August if possible. Given a start before the dark fall days begin, it seems to make a very satisfactory growth, but if left till late, the sowing will result in spindling plants not worth the cost of the seed. I have not tried lupines, but find Canada field pea a very satisfactory plant with good deep roots. It matures so rapidly that it can be plowed under much sooner than the other varieties. My best results have been with peas sown the way of the irrigation furrows, and burr clover broadcasted crosswise. This combination gave us the largest yield of green material ever obtained from a cover crop. Burr cover alone is excellent.

4. I sow 60 pounds of peas, 50 pounds of vetch, or 12 pounds of burr clover per acre. In sowing a combination of peas and burr clover, I would recommend 50 pounds of peas and 8 pounds of burr clover; or if the combination should be peas and vetch, 50 pounds peas and 20 pounds vetch. All experiences go to show that heavy sowing pays well in giving additional growth. The plants seem to shade the ground quickly and do better because of that protection.

5. I would recommend the use of bone well steamed and ground fine in all cases where phosphoric acid is liable to be deficient in the soil. I usually apply the phosphoric acid in the form of tankage in the spring in abundance. If this has not been done, the bone should by all means be applied at the time of sowing the cover crop. We just mix the seed and bone in a box and sow with the fertilizer drill. Would not advise the use of superphosphate in this way, as it is liable to act against the development of soil bacteria and prevent the formation of nodules.

6. I irrigate before sowing and then keep up the irrigation regularly

(Continued os Page 256.)

# Save from $1 to $2 per horse

that you now pay for clipping by doing it with this splendid

## Stewart No. 1 Horse Clipping Machine

New and Improved *1908* Model Ball Bearing and all enclosed gears running in oil. The price at your dealers' all complete, is ONLY $8.50

**Every Horse should be Clipped** Clipped horses look better, feel better, work better, and are easily cuffed. No machine ever made runs so easily, clips so fast, and lasts so long as this *Stewart No. 1.* It is fully guaranteed and must please or the purchase price will be cheerfully refunded.

**All leading dealers have it. Ask to see it!**

It is the greatest clipping machine of all time. If your dealer hasn't it, write to us about it.

**Chicago Flexible Shaft Co.** Dept. H, Chicago

**Onion** White Bermuda, Red Bermuda, Crystal Wax, New Queen. Now is the time to plant early onions in the Great Inland Valleys of Southern California. And we would especially call your attention to our line of imported onion seed. They are all True to Name and "Full of Life." Get our prices on large quantities.

**Try Us on Cabbage Seed—We Have the Goods**

**Sweet Peas** Plant the early varieties now for flowers this fall. The following varieties bloom in 50 to 60 days from planting. 10c per packet, 3 packets for 25c. ***Morris & Snow's Earliest Pure White*** (Gould). ***Earliest of All,*** pink and white, very early. ***Bodger's Earliest Pink,*** New. Proved a great success last year. As early as the Earliest Pure White. (We control this stock.) ***Mount Blanc,*** pure white.

**Eucalyptus** All the Leading Varieties in seed @ 15c per package. (Six of the leading varieties, E. Rostrata, E. Leucoxylon, E. Rudis, E. Globulus, E. Corynocalyx, and E. Tereticornis for 50c. with cultural directions). 500,000 Plants, all varieties. State your wants and get prices.

**Send for Our Catalogue**

**MORRIS & SNOW SEED CO.** 425 So. Main Street Los Angeles, Cal.

**HEADQUARTERS FOR RELIABLE SEEDS**

Complete stock of garden and field seeds. Nursery Stock and Berry Plants of all descriptions. We sell direct to the farmer at lowest market prices. No goods sold to dealers. All seeds are tested by us at our nurseries. Send for our complete catalogue, which will be mailed free of charge. This catalogue contains information not only on gardening, but also how to grow Eucalyptus for profit.

**CHAS. WINSEL - - - - Seedsman**

**251 South Main St., Los Angeles, Cal.**

## The NOZZLE

on a spray pump has everything to do with the efficiency of the pump. The Kant Klog Nozzle on

**THE COMPLETE SPRAYER**

will spray whitewash and any spray fluid.

**Price $5.00**

**HENRY ALBERS CO., 845** S. Spring St. Los Angeles

# SEED GRAIN

**Recleaned Red Oats** **Pure White Australian Wheat**

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 262, 263.

## Soil Fertility.

SO MANY things enter into the production of a plant, from the planting of its seed to the maturing of its fruit, that the soil tiller is often confused. We mean the observing soil tiller, for many, of course, it must be confessed, deposit the seed and await results. In case the crop is a partial or total failure, then it is merely a case of "luck." But there are others that are so full of questions that when failure does come, they bristle with interrogation points until the how of the failure is definitely known, or at least as definitely as possible with our grasp of the great agricultural problems

Perhaps one of the most perplexing of the great questions we have studied is that of the soil. We have found some answers, but there are many more for us to delve after. As one of our contributors says this week: "I wish some hard and fast rule could be given, even in cases where soil conditions are known, which would stop this everlasting groping in the dark." Perhaps if this easy solution were given to us, much of the zest would be taken from agriculture. These are problems which once solved make the calling worthy to be followed by intelligent men.

Not only is the problem hard to solve, but the item of economy must be considered. The soil was given to us originally rich and productive. Years of cropping have reduced this productiveness, not only by the actual taking up of elements by the plants, but by inducing a chemical condition of the soil which renders them unavailable to the roots. Of the many elements required in the production of plant life, all are in such abundance that renewal is not necessary excepting in the case of three, nitrogen, phosphoric acid and potash. The most expensive and most liable to loss through leaching and evaporation, is nitrogen. Only a few months ago, some authorities maintained that the time might come when this element would become so scarce on the face of the earth that human life would disappear because of the lack of food producing power of our soil. If this occurs, however, it will be so far in the future that many generations will pass first. But now that we manufacture nitrate of lime by an electrical process and capture nitrogen from the air by leguminous plants, it appears we can keep abreast of the demand for nitrogen. The first mentioned of these processes is yet in an experimental stage, but the capturing of nitrogen from the air is so general in all agricultural countries that it is adding greatly to our wealth. This process has been deemed worthy of special attention in this week's Cultivator, and beginning with the first page and running through nearly all the paper may be found a series of articles by practical men on their methods of work.

## Humus.

IT WILL BE plainly seen in the articles mentioned in the above paragraph that nitrogen is not the only addition to the soil which must be secured in order to get best results. The soil may be rich in nitrogen, and yet the plants may die or have indifferent growth because the soil may not be in such condition that the roots can secure it. It is made available by the presence of humus or decaying vegetable matter which is in process of transformation into nitrates. Humus permits the active working of the bacteria or nitrifying agency. One of our contributors has said, "With all your getting, get humus."

The need of California soils for this substance has been proven in orchards and vineyards where soil which was exceedingly rich has failed to produce fair crops notwithstanding the fact that expensive commercial fertilizers have been added in abundance. California's hot sun combined with continual clean cultivation has deprved the soil of its vegetable mold or humus until it has become more like cement than a pliable soil. The application of stable manure is probably the quickest way of restoring this factor to the soil. It is likewse the most expensive way. The turning under of green manuring crops seems to be solving the problem. The evidence of a majority of our contributors this week shows that the mechanical condition of the soil has been vastly improved by this means. One or two have found insufficient results, and one has found green manuring of no value, but allows the crops to mature on the land and dry up before turning under the next year.

## Nodules

OUR special articles this week would hardly be complete without some reference to the nodules or root tubercles which are sought for. These ndules are often wrongly considered to ccntain the nitrogen gathered by the bacteria which inhabit them. This is true to a limited extent, but it must be borne in mind that the plant has also absorbed a vast amount of nitrogen from these organisms and appropriated it to its own use. Therefore, the nitrogen which has been gathered may be in the roots or in the branches of the legume. These little living organism seem to have decided preferences as to the host plant which they will occupy. They are only known to inhabit legumes, and not all of them. Also, those that have inhabited one branch of the legume family do not care to use plants of another branch for their hosts. Therefore, where inoculation of soil or seed is desired, it must be brne in mind that the soil must be secured from a field where the same plant has been grown before, or if the purse cultures are used, from the Department at Washington or from dealers, being sure to specify the particular seed which is to be planted.

It is a notable fact that these nodules—and consequent nitrogen gathering capacity of the plant—are far greater in soil poor in nitrogen than in one that is abundantly supplied with this element. They are almost invariably larger on the poorer soil than on the richer.

## Quality of Fruit.

A QUESTION of much interest to the orchardist—at least we have heard it propounded—is: "Will growing of green manure crop and lack of clean cultivation have any effect upon the quality of shipping condition of the fruit?" This query was referred to G. Harold Powell, Pomologist in charge of field investigations. It is well known that Mr. Powell has accomplished a world of good for the citrus shippers of California, but it seems from his letter that he has made no particular investigations along this line. Mr. Powell writes:

"I am sorry that I cannot help you in regard to the effect of cover crops upon the quality of fruit. While I have seen a good deal of this treatment in orchards and have had some 20 years experience with it in our apple orchards in New York, I am not prepared to say what effect cultural conditions have upon the quality, or keeping quality, of fruits.

"We have made a study of the influence of some of the cultural conditions on the keeping quality of apples, but have not carried it far enough to express an opinion upon it. I am sorry that I cannot give you more information along this line, but I do not like to guess at a subject unless I know something about it."

## How to Plant.

THE GREAT majority of the contributors seem to prefer drilling as a method of planting. Broadcasting in some cases gives good results. but where there may be at any time a shortage of moisture, we believe there is no question that drilling will give far better results. Fertilizer drills are sometimes used to sow the seed, but, especially with peas, this would not prove very satisfactory. If commercial fertilizers are to be used with the crop, they should be sown before the seed. This will increase the growth of the green crop, thus giving a greater amount of humus and the fertilizer will be returned to the soil for the use of permanent crop. Irrigate and make as perfect a seed bed as possible. After planting leave ground so that growing crop may be irrigated. That is the only safe way for assurance of a heavy tonnage to plow under.

## Cost of Seed.

IT IS reported that the vetch seed growers of Washington and Oregon have become wise to the fact that California fruit growers have long purses, and they have perfected an organization which is maintaining a most effective corner on the seed. The price is some two cents per pound higher than last year, but while this makes less than a dollar per acre increase in the cost, it is causing some of our growers to rebel. We notice that a recent Portland Oregonian says: "The Lane County Vetch Growers' Association has sold its pool of vetch for $2.50 per bushel. The pool amounts to 3500 sacks, or 7000 bushels. This is the best price yet received for vetch and growers are greatly pleased at their first effort in pooling issues."

The price now prevailing in Los Angeles for seed is: Vetch, $5.50; Canadian peas, $3.75; fenugreek, $10.00 per hundred pounds. The amount required varies with different planters, but as ordinarily planted in orchards, which means of course that the entire land is not covered, the following are the approximate figures: Fenugreek, 16 pounds per acre; peas, 60 pounds per acre; vetch, 40 pounds per acre.

## Report of Cover Crops.

DESIRING as much information as possible on the line of green manuring crops we wrote to the chief of the bureau of plant industry at Washington for any information which the department might have, and received reply from C. V. Piper, Agrostologist, that special attention was being given to this subject by Mr. Roland McKee who is in direct charge of the cover crop green manure experiments in California. Mr. Piper stated that Mr. McKee has a bulletin now ready for the press which will soon be issued. Later Mr. McKee wrote us that the bulletin will be soon available. This bulletin will be watched for with much interest by all orchardists and vineyardists.

# Agricultural News Notes of the Pacific Coast

## Northern California

Chico farmers have organized a local union.

Gridley producers have formed a farmers union.

A farmers union local has been organized at Gridley.

Yuba City dried fruit plant began on figs the first of the month.

Farmers of Tehama have united and will build an alfalfa mill.

Anthrax has carried off 200 cattle on four ranches in Solano county.

The sugar beet harvest began in Yolo county last week. The yield is heavy.

A large hop producing concern at Gridley had a strike on its hands last week.

A Humboldt county dairyman has been securing a number of high bred Guernseys.

A large picking force began work in the hop yards near Chico the first of the month.

A San Francisco dealer has been found attempting to sell oleomargarine as butter.

"Lake County Mountain Fruit" is the brand under which pears from Lakeport are shipped.

The grain dealers have, as a rule, refused to pay the prices which farmers demand for wheat.

Shasta county's prune crop will bring to that country nearly a quarter of a million dollars.

Petaluma has a new brooder which it is said can be operated with much less fuel than the old style.

Anderson, Shasta county, says it has the finest crop of Bartlett pears ever produced in the Valley.

Close estimates of the Butte county orange crop indicate a very light yield, but the fruit will be large.

The sugar beet harvest at Woodland, Yolo Co., has been seriously interferred with on account of shortage of labor.

A ton of tree seed has been gathered in the various forest reserves to be used next year in more extensive forest tree planting.

The largest shipment of wool ever made out of Humboldt county, was last week when 400 bales went to one Boston firm.

The largest shipment of eggs ever sent out of Petaluma was on August 28th when 82,900 eggs packed in 2,200 cases of 36 dozen each, went to Alaska.

One of the vegetable curiosities of the world is growing at Sims, Shasta county. It is the "pitcher" plant which has the faculty of trapping and devouring insects.

A river improvement association has been formed at Rio Vista, Solano Co., and $80,000 has been subscribed, for the purpose of improving the outlet of the San Joaquin and Sacramento rivers.

The olive crop at Oroville, Butte Co., will be larger than usual this year and efforts are being made to have a large curing plant at which an expert shall be in charge of the pickling.

## Central California

The Corcoran sugar factory has been closed for the season.

Raisin grape picking will start later this year than usual.

Kern county's agricultural fair is holding its second annual exposition this week.

Fresno county produces more olives than any other county in the San Joaquin Valley.

A Kern county apple grower exhibits at the fair at Bakersfield apples 15⅜ inches in diameter.

San Jose holds a fancy horse show this week. Several hundred horses of all grades have been entered.

Many of the pepper trees of the Santa Clara Valley are reported to be dying from some strange disease.

It is predicted that Lodi grape growers will build a number of independent wineries for handling the output of Lodi vineyards.

The Pacific Sugar Co. is now working 100 employes. The factory expects to put out from 70,000 to 80,000 sacks this season.

The California Fruit Canners Association reports the demand for canned fruits excellent and heavy shipments being made East.

Some Woodland grape growers are preparing to feed their grapes to hogs rather than accept the five dollars a ton price which the wineries are offering.

The San Benito Valley hay crop is now said to be somewhat smaller than anticipated earlier, and the warehouses will contain practically the entire crop.

Two crops of Turkish tobacco have been grown near Exeter and promise is made that the future will see it a material factor in the agricultural products of that section.

Some members of the farmers union at Hanford Kings Co., have withdrawn because of lack of interest among many other fruit growers in co-operative marketing methods.

A proposition has been made that a floating exposition of California's industries be planned for the year of the canal opening, the Exposition to visit not only eastern ports of the continent, but foreign countries.

Definite announcement is made by the California Wine Association that the price for wine grapes will be five dollars per ton, payments to be made in two installments, the first on the 15th of December, the second on the fifteenth of the following March.

The shipping of green fruit is not exclusively the heritage of the orange growers. We note the Pajaronian is calling down the apple shippers of the Pajaro Valley and begging them to refrain from sending out green bellefleurs and Newtown pippins.

Orchardists near Madera report the latest fake in the man who visits a place representing that he has been sent out by the state to examine trees for scale and diseases. This fellow is followed by another who is "sent" to treat the trees and collect the costs.

## Southern California

Chino has a new barley crushing mill.

Riverside has shipped 5300 cars of oranges.

The Santa Ana sugar factory is running 600 tons of beets per day.

Little Rock in the Antelope Valley has shipped its record crop of Bartlett pears.

Highland, San Bernardino county, shipped about 2038 cars of oranges during the past season.

A rancher at Banning, San Bernardino county, has baled 1800 tons of hay from 600 acres.

Some experimental plats of the long fibered Egyptian cotton are now growing near Brawley.

A recently invented beet topping machine has been tested at Oxnard and declared to be a success.

Chief Forester, Gifford Pinchot, recently visited some of the forest reserves of Southern California.

San Diego county fair is on at Escondido this week. Today is the principal day with its grape festival.

An olive grower in the foothills near Orange has found his olive crop exceedingly profitable for the past few years.

The big Bear Valley reservoir is still full to the brim and it is now thought that it will remain full until the end of the irrigating season.

The bean growers of Smeltzer, Orange county, held a meeting last Saturday and organized an association to co-operate with the Ventura people.

Several stalks of recently imported mammoth bamboo from Japan, planted at El Centro, have failed to root, and others have been ordered for another trial.

It is announced that the Yuma Indian reservation lying within Imperial county and embracing about 17,000 acres, will be thrown open to entry next month.

The Oxnard sugar factory is making a record run this season. It is now slicing about 2200 tons of beets every day, which is 200 tons more than the official capacity of the plant.

White scale has appeared in some of the orchards of San Fernando Valley, and some are concerned regarding the outcome, but we doubt not a colony of vedalia will solve the problem.

San Bernardino County Fruit Exchange shipped for its members 850 cars of navels which averaged $1.51 per box f.o.b. This will net to the grower above packing charges about $1.65 per hundred pounds.

In spite of much smaller crop and expectations of proper remuneration, the melon growers of Imperial Valley find on complete returns and payment of expenses that the year has been anything but a profitable one.

A San Fernando bee man is suggesting the formation of a large corporation which shall take over the apiaries of the state, maintaining that a much better distribution and better returns could be secured for the producers.

## The Coast

Seattle recently received 73 cars of wheat in three days.

Wenatchee, Wash., is planning for a better road system.

Oregon's wool output this year will net the state about $4,000,000.

The judges for the coming National Apple Show at Spokane have been chosen.

Many farmers near Palouse, Washington, have averaged 45 bushels of wheat per acre.

More than 70,000 bushels of wheat have been delivered at the Nez Perce, Idaho, warehouses.

A new wheat introduced at Pullman, Washington, makes a record of 75 bushels per acre.

Asotin and Whitman county, Washington, wheat growers are declining to sell at less than $1.00 per bushel.

The Yakima Valley, Washington, prune output will be about 90 cars, which is practically the same as that of 1908.

Owing to scarcity of forage in some of the forest reserves of New Mexico, cattle have eaten the leaves of the scrub oak and many have died.

Much damage was done by the recent storms in southern Arizona, not only in destroying hay but doing great damage to the irrigation systems.

Arrangements are being made by the State Horticultural Association of Washington, for its next meeting at Wenatchee about the end of December.

Poultry fanciers at Spokane, Washington, have organized the Inland Empire Poultry and Pet Stock Association and will hold their first show January 11th to 15th.

Expert buyers who have traveled over Washington and Oregon report that the output of wheat this year will be 65,000 bushels, which is 25 percent greater than ever produced before.

Owners of water rights under the Sunnyside Canal near North Yakima, Washington, have preferred charges against the manager, and Secretary Ballinger promises to give thorough investigation.

All the states of the arid west excepting California, Washington, Arizona, and Montana have adopted codes which have proved of great value in controlling the use of waters of those states.

Various co-operative farmers associations in the Inland Empire of Eastern Washington are considering the advisability of uniting the management of some 200 grain warehouses under one director.

Officials in charge of the forest reserves in Arizona have confiscated several hundred cords of wood which had been cut from green standing timber. Permission had been given for the cutting of dry and dead wood.

The Portland Oregonian says that a commission merchant of Woodburn, Oregon, controls the vetch market of Oregon and California. Vetch growers the state over are in high glee over prices they are commanding this year.

**FOR MOULTING HENS**

**Feed**

# MIDLAND

## Poultry Food No. 4

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

**Petaluma Incubator Company**

**Petaluma, California**

Our General Agents for Incubators and Brooders and Midland Poultry Food:

**Petaluma Incubator Co., Petaluma, Cal.**

**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**

**Berrar & Robertson, San Jose, Cal.**

**For Eggs Next Fall Feed Now**

# West Coast Egg Food

Don't make the common mistake of supposing that you can let the fowls get all run down before or during molting and then bring them up by heavy feeding later. You won't get eggs that way. They must be kept in good condition and fed feather producing and egg making food. We know how to make rightly balanced rations for such purposes. That is our business, and we have the best equipped mill for doing it, or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg Food, as good as anybody can make, by using

# EGG MORE

and you will get no unsound grain, no mill refuse and such stuffs, as are in many concoctions called Egg Food. Egg-More is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs if you feed it just a little each day. 25 lb. sack, $1.90; 50 lbs., $3.60; 100 lbs., $7.00. If not kept by your dealer we will prepay freight within 300 miles.

**West Coast Mill**

**Cor. Griffin and Alhambra, Los Angeles**

***MRS. C. D. HUBBARD'S*** ***WHITE WYANDOTTES***

Eggs for hatching September 1st '09. Write for circular.

***BOX 60, ROUTE NO. 1*** ***SAN FERNANDO CAL***

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

## CLEANLINESS ABSOLUTELY NECESSARY.

CLEANLINESS is the most important consideration in poultry raising no matter whether the flock is large or small, fancy or mongrel. It matters not how carefully the breeders are selected or how well the ration is balanced, failure is certain if houses and yards are not kept in sanitary condition. It would seem as if this lesson should have been thoroughly learned, at least by those who depend upon poultry raising for a living.

Since the establishment of the first poultry journal cleanliness has been preached until it ought not to be necessary to harp upn it any longer, yet a trip of inspection will show many yards where cleanliness seems to be a secondary consideration. While this to some extent applies to professional poultrymen, it is more particularly applicable to the hundreds of small farm and village flocks, not one-fourth of which receive the attention they should have to make them profitable. This is due to the fact that the average farm or village flock is regarded merely as a source of supply for the table and occasional pin money for the housewife. Even at that they would well repay one for careful attention, but many are too short-sighted to see it.

To keep it in perfect sanitary condition the poultry house must be conveniently arranged. Walls ought to be tight not only for warmth but to afford as few hiding places for lice as possible. For a house built of rough, uneven boards, a lining of tar paper is advisable.

It has been my experience that dirt floors are better than any other if properly made. They are more easily cleaned than board floors, warmer, drier, and better in every way. The floor must be several inches higher than the ground outside, and good under-drainage is essential. An excellent plan is to excavate ten or twelve inches below the surface and fill in with coarse gravel. On top of that put a layer of finer gravel, cover it with sand or dry earth, then pack tightly by tamping. Cover the floor with cut straw to the depth of eight inches. With a properly built dropping platform beneath the roosts the straw need not be changed oftener than once in two weeks, though once a week is best.

Board floors are apt to be damp and require more attention than dirt floors. A six inch layer of sand or dry earth on them makes cleaning easier.

Droppings ought to be removed from the poultry house not less than twice a week. It is much better and entails little more work to remove them daily. Only a few minutes are required each morning and the droppings are not left to be scattered about or to ferment and spread disease. I have seen in many farm poultry houses droppings scraped in piles at one end of the house and left to contaminate the air. Often, too, the poultry house is made a sort of catch-all for all sorts of rubbish. Old shoes, bits of lumber and other refuse are tossed on the heap, making a hiding place for rats and a breeding place for innumerable vermin.

No matter how clean the houses are kept otherwise don't neglect to oil the roosts quite frequently, coating them thoroughly all over. Any good commercial lice paint may be used or a mixture of kerosene and carbolic acid is as good. Use insect powder freely in the nests and see that the straw is changed every week. Use whitewash freely, spraying it into every crack and corner.

During the summer months I always keep several dust baths handy in various parts of the poultry yard, but it is necessary to have one inside the house for rainy weather and through the winter. If there is a scratching shed connected with the house it is a convenient location for the dust bath, but no matter how limited the space, have one somewhere. It is indispensable for the cleanliness and health of the fowls.

Not only the house and its furnishings but the yard, as well, must receive careful attention. Of first importance is location, for a yard without good drainage cannot be kept in sanitary condition. Sometimes a yard must be located on ground not naturally well drained, in which case it must be tile drained if one is to have a decent yard. An orchard on moderately sloping ground, preferably sloping south or east, is an excellent location. But if an orchard is selected, don't do as I have seen many farmers do. When the apple trees were pruned the brush was piled in heaps about the yard and left to become a hiding place for rats.

With the approach of warm weather we must give the feed troughs and drinking fountains more attention than has been necessary through the winter. Particles of food left in the troughs soon become sour in warm weather and if then eaten by the fowls may cause serious bowel troubles. The drinking vessels will require frequent cleaning and refilling.

It is no easy matter to attend to the thousand and one things that are to be done about the yard. Cleanliness means constant watchfulness and lots of work, but it cannot be neglected if one is to succeed, but for those who really like the work and go at it conscientiously and intelligently, there are ample rewards.—Successful Poultry Journal.

## POULTRY QUERIES.

### Dry Feed Hopper.

Please give instructions for making dry feed hopper.—C. L. K.

We reprint from issue of February 14, 1907, a couple of engravings which

FIG 1

show plainly the construction. These may be made from packing boxes very cheaply.

The fowls can eat from both sides of this hopper, as will be seen from the dotted lines. It is made from a cracker box and holds nearly two pails of ground feed.

Another plan which allows birds to eat from only one side but permits various kinds of feed is as follows:

FIG 2

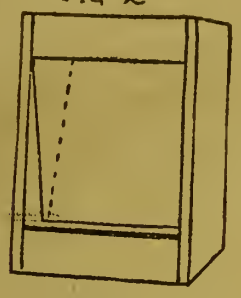

FIG-2

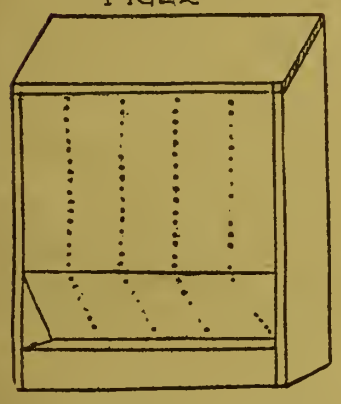

The above front view shows five inside divisions in which is placed the different foods. The hopper can be made with or without these, the size depending upon the size of the flock and the frequency of feeding. The trough into which the feed falls should be three inches deep and should have a beading on the edge an inch and a half wide to prevent the feed from being scattered out.

Cross sticks may be placed over place when feed falls down so fowls may not scratch out and waste the feed.

Set the hopper on a bench or shelf in the poultry house in such a way that the fowls cannot scratch straw or dirt into it.

Another formerly shown in issue of August 29, 1907.

To make a feeder take a board ten inches wide; from this cut one piece two feet long for bottom, two pieces 18 inches long for ends and support for roof. Nail bottom to end of boards four inches from end; now saw long end, shape of letter A. Take two pieces of ten inches wide and thirty inches long, nail in shape of trough or V, turn this upside down over A-shaped ends for roof; now take two pieces four inches by two feet, nail on for sides and your feeder is ready.

We give as our model the two-foot length but it can be made any length desired. A partition can be put in if desired for different kinds of food, grit, charcoal etc.

### DOUGLASS MIXTURE.

We have had numerous inquiries of late for a recipe for making Douglass Mixture. This is a preparation of iron. Mix one ounce of sulphuric acid in two gallons of water. Add to this one-half pound sulphate of iron, known as copperas. When all is thoroughly dissolved and well mixed together use one tablespoonful of Douglass Mixture to each pint of drinking water for the fowls or pigeons.

We have also been asked to give the recipe for saffron tea. Saffron tea is made from yellow saffron, sold at the drug stores, commonly used to make tea for children who have measles. To make saffron tea you use saffron and water in about the same proportions as you would in making ordinary tea. After boiling thoroughly strain through a rag and use by mixing a little in the drinking water of pigeons when needed as a tonic.—The Feather.

---

It is a well known fact that lice breed much faster in filthy quarters, so it behooves every poultryman to clean the houses thoroughly at once, and to keep them clean. Whitewash thoroughly, use some good insecticide around the nests, roosts, dropping boards and in all the corners and crevices and cracks, and the battle against these pests is more than half won.

---

Dry ashes scattered over the roosts and dropping boards every day or so, and a good spray of coal oil once a week, is a cheap but effective means of keeping lice and mites under control.

**Coulson's**

**EGG FOOD**

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

### GREEN MANURE CROPS.

(Continued from Page 251.)

until the rains take the place of irrigation. The furrows are made immediately after sowing and left open.

7. Date of planting depends upon time of irrigation. From August 25th to October 1st is best.

8. The manure crop does not in the least interfere with orchard operations.

9. I prefer to plow with a good disk plow and have no difficulty in covering the green crop all up. We begin plowing early in January, and aim to have the orchards clean and in good tilth by March 1st. We plow when it ought be done, irrespective of the condition of the crop. That is why we sow so early. I had peas and burr clover three feet high in January last year. If not practicable to get over the ground fast enough with a plow, we disk and break it, and then plow at leisure. In order to get a good job of plowing, the surface must not be dry.

10. I do not harrow until the rains cease. I leave the surface rough during the wet season. Thus it takes in more water and washing is prevented. The whole mass of green material will decay in four weeks if the soil is damp enough.

11. I have no way of estimating tonnage.

12. The cover crop has given life to my soil and increased its water holding capacity to an astonishing degree. The soil is more friable, and the question of hardpan or plowsole is entirely solved in my soils.

**Horace G. Keesling, San Jose, Santa Clara County.**

The subject of green manuring or cover crops is very interesting to me, and I will be glad to read the letters from those who will write for the Cultivator.

Very little attention has been given to this matter in this country except an increasing habit among fruit growers of letting the natural winter growth get well grown before plowing.

I know of no one who has made a practice of sowing seeds for the purpose of raising green manure crops.

My next neighbor Mr. J. A. Harris has sown some kind of peas in his cherry orchard and they are now up and growing nicely. I think that this is his first experience.

**A. G. Schulz, Porterville, Tulare Co.**

We have not done much green manuring in this locality, and so I have not had much experience in this matter. You know that we get into our orchards the last of October and pick until the middle of December, so whatever green crop we have in the orchards, is pretty tramped by that time. I am therefore not in a position to help you out on this matter, but will be very anxiously looking for the September number to see what others have to say. We are trying to work into the green manuring proposition, and are looking for information along this line, and of course are very much interested in your efforts to disseminate this knowledge.

**Gerald Geraldson, Newcastle, Placer County.**

I used to believe in green manuring. My father practiced it on this orchard forty years ago, and I took up the work where he left it and plowed under green grass year after year until the soil finally rebelled, went on a strike, and declined to produce any more grass to plow under. Where first the natural crop of grass grew twenty inches high now it grew two inches. Where formerly the trees bore large crops of good fruit they now bore but light crops of very poor fruit.

The process of deterioration had been going on from the first; I recognized it vaguely but thought that I was doing all anyone could by plowing under the spring crop of green grass, keeping the "pesky weeds" out of sight, hauling all the manure I could get and putting on some chemical fertilizer now and then for good measure.

I took it for granted that the soil must eventually wear out, for did not the authorities, and the neighbors say so? And did not soil in other places wear out? Was not the older East sprinkled with abandoned farms, which must have worn out.

As the land became more and more like Portland cement in its baking proclivities, more and more like desert sand in its washing tendencies, and more and more like rock in its capacity to absorb and hold water and to grow further crops of grass to be plowed under green, I became alarmed. Being naturally of a skeptical and irreverent turn of mind I began to question whether or not the authorities and the neighbors might not, after all, be at fault; and whether, after all, the advantages of the sacred system of clean annual cultivation might not be more imaginary than real.

Upon looking about me I observed that in detached fence corners which were neither plowed nor pastured, the grass grew rank and ever more rank and the soil was "rich" and "mellow" to a degree that made that in the orchards look like a bed of clinkers.

I observed that in the forests, where Nature was managing matters, there was a continual depositing of leaves,

# The Ames Continuous Flow Deep Well Pumps

Deliver a continuous stream from lower end of cylinder in well to point of discharge. They run continuously day and night without care or attention except to oil.

All of the valves or working parts of both our single and double acting pumps can be removed, repaired and replaced without pulling up the cylinder or heavy column pipe or moving the power head off of its foundation.

**Write A. T. Ames Manufacturing Co., Niles, Cal. for Catalog**

twigs, bark, cones, shells; that the soil was "rich" and "mellow" and was evidently getting no poorer as the years rolled on.

But, had I not put into the soil hundreds, yes thousands, of tons of vegetation; in addition, had I not plowed and worked the soil, which the authorities and the neighbors said was good; and had I not manured it and chemical fertilized it? And still it had gone bad on me.

Then I examined the much plowed soil and found it dry and harsh, mostly little stones like grains of sand cemented together by other little stones still finer, into clods as hard as brick and about as fertile.

Then I examined the soil in the fence corners and in the forest and found that it was soft and mellow and that there was a large percentage of some soft dark substance mixed with the little rocks which effectually nullified their tendency to cement together in clods, and which, combining with them formed a soil which would retain large quantities of water and in which anything that I tried would grow readily.

Then I learned that this soft dark substance was "humus"; that it is the all important factor in any soil; and, greatest and most important of all that it is always and everywhere and under all circumstances made from matured vegetation. Never, anywhere, does Nature attempt to make it of green vegetation.

And Nature is a pretty dependable guide.

Here a great light dawned upon me and I saw that for all these years I had been trying to make humus out of water; that, in plowing under all these crops of green grass I had thwarted Nature in her efforts to make soil and had destroyed, yes utterly wasted, crop after crop of green grass with which she had intended to make humus for me.

I found that green grass is about 95 per cent. water while matured vegetation of any kind not only deposits more of any chemical element it has, than the green form, but it also contains many times more cellulose, perhaps fifty times more, and cellulose is what humus is made of.

Our system of clean annual cultivation had absolutely stopped Nature's process of making humus; had used up, wasted, worn out and otherwise destroyed that formerly in the soil, and was fast making the soil incapable of producing any more.

Nature always keeps the soil covered to prevent wash and to hold moisture. Our enlightened system makes conditions perfect for unlimited wash, both by rain and irrigating water and that is where most of the humus goes.

The stable manure we had used was the only redeeming feature of our miserable experience. It contained matured vegetation which made humus, but it was only a handful and could not stem the tide of waste we had encouraged by use of the plows.

Out of suffering comes wisdom. Out of ours came a remedy; not a makeshift, but a real, bona fide, practical, and absolutely sound remedy. We simply adopted the plan of plowing alternate "middles" in our orchard on alternate years, across the flow of the rain and irrigating water.

This plan allows half of each year's crop of grass to ripen and mature and deposit seed. It prevents wash and does good, in various other ways, to the soil.

Whereas, eight years ago, when we adopted this plan we had two inches of grass, we now have from two to six feet. Whereas, then, our soil was like Portland cement after being wet, now it is like that in the fence corner. Whereas then our trees were chronically hungry and thirsty and bore small crops of poor fruit, now they bear large crops of good fruit and appear sleek and well fed. Whereas then we irrigated weekly with poor results, now we irrigate at intervals of two weeks and more with good results. We use no more stable manure than formerly and no chemical fertilizers.

Next to that of the proper distribution of wealth this is the most important question confronting the civilized world today. Soil waste from cultivated areas is causing the world incalculable loss. Nothing but new areas has kept us solvent thus far. If our present barbarous social system and our present barbarous agricultural system endure another fifty years the world will be utterly bankrupt.

The over cutting of our forest areas, the over grazing of our pasture areas and the over plowing of our cultivated areas are all one and the same thing and are all wanton, criminal and idiotic waste. They all remove from the soil too much of Nature's covering.

With Nature's covering conserved the forest areas will produce infinitely more than they will as managed at present; the pasture areas will produce infinitely more and so will the farming areas.

Nature is not so wanting in resource as to let soil wear out. Her way is to get crops and at the same time have the soil get better and better for ever. The question is: Have we the brains to imitate her?

Talk of over population is absurd. Under a sane civilization and a sane system of handling the soil, this earth could support one thousand times its present population, aye more.

### THE PRINCIPAL POINTS.

Use a deep rooting plant if possible.

Vetches seem to be preferred though Canadian field peas are a close second.

Many prefer to precede the sowing of the green manure crop by drilling in either a complete fertilizer or one rich in phosphoric acid.

Ground should be left so it can be irrigated in case rains are not frequent enough.

Sow early and plow under early. In any case use the winter crop, then if abundance of water permits, a summer growing crop may also be advisable.

If seed for leguminous crop proves too scarce or too high priced this year, rye or barley will surely add humus, if they are not nitrogen gatherers.

The general preference seems to be to plow under when plants are in bloom if possible.

On account of its deep rooting, many consider alfalfa of greater value than any other crop tried.

The ground should be thoroughly irrigated before seeding, and a good seed bed should be made. A little extra work at this time will add largely to the tonnage

The disk seems to be preferred as a means of getting the crop under.

Besides addition of humus and fertility, one of the points made is that "The roots create good channels for the rain to penetrate deeper into the soil.

"The question of hardpan or plowsole is entirely solved since I began green manuring."

**Spread Manure with the Roller-Bearing, Light Draft**

**SUCCESS SPREADER**

Save half the labor both for yourself and horses and make the manure go twice as far as by hand spreading. The Success pays for itself over and over again in increased fertility of the land. # Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Dairy Supplies.

I have a fine milking and dairy cow but a very hard milker. The trouble seems to be in tightness at the end of the teats. Can I successfully dilate the teats so that they can be milked easily without using a plug or dilator at each milking time? Where can I secure the instruments necessary? Also where can I get metal ear tags? What should I plant with the first rains in order to get earliest and best feed for cows?—W.

Write O. J. Webber Co., Los Angeles, for instruments and instructions. They also have the ear tags. Cow peas, Canadian field peas, barley and rye, all make good winter feed for stock.

### Arabian Alfalfa.

Having seen statements in your paper regarding the desirability of Arabian alfalfa, I wish to inquire if it will be the best variety in the Turlock section. Where can the seed be secured, and at what cost?—L. P. R., Waterford.

Arabian alfalfa would doubtless be most desirable for the Turlock section. The only trouble is inability to secure seed. It will probably cost double that of ordinary alfalfa. As soon as seed can be located, we will inform our readers.

### Silo.

Where lumber is scarce, can a hole dug in dry ground be utilized for a silo? If not, kindly give directions for building a cheap silo.—Subscriber, Guernsey.

The early silos away back in the 14th century were holes in the ground, but as these were gradually abandoned for the above ground silo, it is reasonable to suppose that the over top silo was superior enough to pay for itself. The sugar beet pulp was at first put into holes, but now it too is put into long racks on the ground, sided up eight or ten feet high. The objection to the silo in the ground is that it is not drained, but the moisture not only from the silage, but from the ground would be retained, unless there was some way of making it dry. The cheapest way to make a silo is either to get the lumber already cut for the silo and the entire silo in the knock down from a company that makes it a business to supply them. The other alternative would be to get the iron rods and build one out of concrete using cement mixed with gravel and small cobbles. Wherever a wash is near by it is possible to do this cheaply enough to be practical. Write to the Department of Agriculture at Washington for Farmers Bulletin on Silos.

### Soft Brown Scale.

I am sending by mail leaves of lemon tree affected with some form of scale. Please advise me what variety it is and what solution would be best to spray with. Would like to say that we appreciate what the Cultivator is doing and find it invaluable in the home.—V. B., Carpinteria.

The scale on leaf enclosed in letter from Carpinteria is according to "Fernald's Coccidae of the world," Coccus longulus. The old name of this scale was Lecanium longulum. Its habits are similar to Coccus hesperidum or as it is commonly called soft brown orange scale.

The remedy which I usually recommend, (as it is usually only on a limited number of trees) is whale oil soap, 12 ounces dissolved in one gallon of water; apply twice ten days apart.—S. A. Pease, San Bernardino.

### Frost Protection for Young Trees.

What is the best protection for young trees against frost? Are corn stalks as good as the frame covered with tar paper to be removed during warm weather, or is a small lath house set over the tree better? The orchard is a small one and expense no object.—J. Allen Osmun, Rivera.

The covered frame would be preferable. It need not have a top, for if the sides are protected against the sweep of the air, it seems to hold a body of warm air around the plant so that no injury comes to it. The writer had experience with a citron forwarded by the department at Washington, which he wished to be sure would carry through the winter. A headless barrel was dropped over the plant and removed, as suggested by the inquirer, at times when the weather was so warm that no injury could result to the young plant. An extremely hard frost came, and while the top projecting above the barrel was nipped severely, the leaves under a line even with the ends of the staves, were uninjured. We would prefer this to the lath cover, although we presume that would be sufficient. Corn stalks are very satisfactory in protecting the trunk, but of course the leaves which project beyond the wrapping will be nipped. This is the most economical method, especially in large commercial orchard.

### Feijoa Sellowiana.

The article appearing a few weeks ago in the ornamental garden department of the Cultivator in regard to a desirable new plant, feijoa sellowiana, has brought many queries as to where it may be secured. Dr. Franceschi of Santa Barbara writes us that this plant was introduced by him a few years ago. He says: "Regarding its hardiness, I have not the least doubt that it will be perfectly hardy all over California. In South America, where it is a native, it appears to have a rather wide distribution, namely from the State of San Paulo in Brazil down to Argentina and Urnguay.

Good plants, from 3½ inch pots can be furnished by the Montarioso Nursery, Santa Barbara, of which my daughter Miss E. F. Franceschi is now the proprietor. These are one year seedlings from the specimen at Montarioso, one of the original plants imported by myself some years ago, from Southern France, where it had been introduced from Montevideo by the well known traveller and Landscape Architect Edouard Andre."

Mr. C. P. Taft of Orange, also writes that he has fine plants for sale.

### Sorghum.

I would like to know if sorghum is good feed for cows, and the best way to feed it. Is there any danger in the seed?—Subscriber, Phoenix, Arizona.

(Continued on Page 263.)

**Buy Fall Chicks**

They are the easiest to raise, and will begin laying when the eggs are high. We will have off a BIG HATCH every week, send today for price list, and full particulars. If you buy chicks now and make a small deposit you can get them any time and at the same old prices. Later when eggs get high we will have to raise the price on chicks. Hadn't you better send in your contract now and buy at the low prices while you can. Later you will pay more money for the same chicks. We are giving you a chance. Better investigate today. Our chick book is free.

# The State Fair

By John Isaac, Redwood City.

THE fifty-sixth annual state fair, which closed in Sacramento on the 4th, inst., was somewhat of a disappointment. This was probably due to the fact that the industrial portion of the display was held in the new buildings which are still unfinished and which gave an unfinished tone to the whole thing. The old pavilion on the Capitol grounds, in which these fairs have been held for so many years, has been torn down, and in its place three new buildings have been erected in the fair grounds. One of these is the agricultural building, one the manufactures building and the third is devoted to industrial displays. It is probable that the exhibits were fully up to those of previous years, but divided into three parts and exhibited in rough unfinished buildings, they did not impress the visitor as strongly as former exhibits have done.

**Opening Day.**

The fair was thrown open to the public on August 28, although the formal opening was delayed until the following Monday. Few exhibits were in place or finished, but by rushing work, the exhibitors had nearly everything in shape before the formal opening took place.

Sunday was a busy day, very many of the exhibits still remaining to be put in shape, while crowds of residents of Sacramento, whose daily labors prevented their attendance on other days, took advantage of the opportunity to be present. The feature of this day was a concert by a boys' band and a chorus of 150 voices from the Preston School of Industry. The performance was heartily encored and was the leading attraction of the day.

**County Exhibits.**

County exhibits were made by nine counties, Sacramento, Kern, Alameda, Los Angeles, Fresno, Sonoma, Contra Costa, Monterey, and Solano. All these, except Sacramento, which being the home county, kept out of the running, were entered for the prizes offered for the best county exhibit, carrying with it an award of $600. This award was made to Alameda by the judges, Los Angeles coming in a close second. Mr. Nichols, who has made a reputation as a decorator, was the artist to whom Alameda owed her victory, and certainly her exhibit was at once the most varied and the most artistically arranged in the building. Los Angeles' display was noticeably good, while in the line of fruits and agricultural products Sacramento easily stood at the head, but being out of the running no award was made her.

**Machinery.**

In the machinery building the most noticeable exhibits, and those which attracted most attention, were the irrigation plants. There were a number of these pumping streams of water which would have made a man wealthy could he have taken them to the south.

**Live Stock.**

The stock exhibit was larger than usual and more interest was taken in it. Aristocratic members of the cattle family were there from different parts of the Union, some contributions coming even from far-off New Hampshire, a herd of Dutch belted cattle being exhibited by F. R. Sanders, of Bristol, N. H. The stock parade, which was held on Tuesday, was organized by C. R. Paine, the manager of the live stock display. It was perhaps the best display of high bred horses and blooded stock ever brought together in one body in the state, and represented most of the favorite varieties. Among the horses were German coach horses, hackneys, carriage horses, Normans and Percherons. The cattle attracted as much attention as did the horses, and there were here a fine herd of shorthorns owned by Mrs. Glide. The Howard Cattle Company also had a herd of blooded short horns, while the Lomas Company showed short-horns, Herefords and Polled Angus. A. W. Morris displayed Holsteins. The Stanford University farm at Vina also had a herd of Holsteins; Geo. A. Smith, of Corcoran, N. H. Lock, of the Lockford Co., Guy H. Miller, of Modesto and J. E. Thorpe, of Stockton, were there with Jerseys. There was also a very excellent display of the different breeds of sheep and hogs with some good specimens of Angora goats. Taken altogether the exhibit of live stock was an exceptionally good one.

**Poultry.**

For the poultry exhibit, a new and commodious building has been erected and this was well filled early in the week. There was a larger and more varied display of poultry than usual, and hardly any known variety that was not there. The accommodations in the new building are much better than they could be in the old pavilion, the building is better lighted and the attractiveness of the ex-

(Continued on Page 263.)

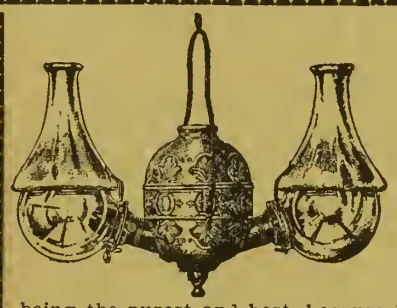
New building, new equipment; located in the best business district. One of the lightest, most convenient and best-equipped business colleges in America. Write for information about the great opportunities offered to trained office workers in the new San Francisco.



## Angle Lamp

### The Light That Never Fails

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

**NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT.**

**GREAT ECONOMY—COST LESS TO BURN** than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT**, soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

**The Wm. Peck Co.**

**2803 Folsom Street, San Francisco, Cal.**

The shortage in the orange crop is not so severe as predicted earlier. As a rule, the leading orange sections maintain the crop will be seventy-five per cent of that of last year.

Coachella Valley is contemplating establishing a permanent exhibit of her products at Indio in order to show the merits of the country to tourists passing through that place.

# Household Department

### CLEON AND I.

Clean hath a million acres, ne'er a one have I;
Cleon dwelleth in a palace, in a cottage I;
Cleon hath a dozen fortunes, not a penny I;
Yet the poorer of the twain is Cleon, and not I,

Cleon, true, possesseth acres, but the landscape I;
Half the charms to me it yieldeth money can not buy.
Cleon harbors sloth and dulness, freshening vigor I;
He in velvet, I in fustian, richer man am I.

Cleon is a slave to grandeur, free as thought am I;
Cleon fees a score of doctors, need of none have I;
Wealth-surrounded, care environed, Cleon fears to die;
Death may come, he'll find me ready —happier man am I.

Cleon sees no charms in nature, in a daisy I;
Cleon hears no anthems ringing in the sea and sky;
Nature sings to me forever, earnest listener I;
State for state, with all attendants, who would change? Not I.

—Charles Mackay

### HESITATING SIM.

THERE had been a customer in the store who had wavered ten minutes between two grades of draw shaves and had ended by saying that he would look around a while and see if there wasn't something over at the hardware store which would suit him better.

"He's like Sim Hoisington," remarked Wash Hancock when he had gone. "Sim was that kind of a feller. He'd start to build a fence around a hawg lot an' use up the best part of a week figgerin' whether to go to the sawmill an' get him a load o' eight-inch stuff or to split rails. He'd start in with the rail idea an' allow that by the time he'd got all the rails split he'll wish he'd jest hitched up his team an' got boards.

"'You get a board fence an' you've got suthin' that's hawg-tight,' the neighbor'd say. 'Put up a rail fence an' mebbe you'll keep your hawgs inside of it an' mebbe you won't, an' you'll waste more time chasin' em than the lumber'll cost you.'

"Then Sim 'ud scratch his haid an' he'd say, 'By jucks! I reckon you're right. I'll hitch up the team this afternoon. 'I've be'n needin' a bunch o' shingles, anyway.'

"'Erlong about noon Sam's hired man 'ud come along up from the field an' Sim 'ud tell him he'd changed his mind about them rails, an' he'd fence with boards.

"'It don't make no difference to me," the hired man 'ud say, 'but I hearn tell they're askin' $10 a thousand for rough boards now an' you'll need a couple o' thousand foot. The rail ain't goin' to cost you nothin,' but the work o' gettin' 'em an' the roads is bad betwixt this an' the mill.'

"Sim 'ud scratch his haid again an' study. Then he'd say, 'I dunno but you're right, Bill. If I don't use up that there white oak for rails there ain't nothin' I can use it for, 'less'n it's firewood. I'd hafter buy nails, too. I never thought o' that. We'll grind them axes an' put a new handle in the maul first thing after dinner.'

"Then while they was grindin' the axes the schoolmaster'd stop to gas as he went by an' he'd nachally ast 'em where they was goin' to chop an' what they wanted the rails for.

"'Well,' he'd say, 'course I hain't no farmer, but seems like to me that a 'rail fence is the wastefulest kind of a fence. You take a 12-foot rail and lay it at an angle o' 45 degrees an' then count in the lay an' you're wastin' about three foot of it. Three foot mor'n if you were building a straight fence. If you stake and rider it you've wasted 21 foot o' rail on each panel. Then you count your land wuth sothin' don't you?"

"'I cert'nly do,' Sim 'ud say.

"'Then you've got the jog on each side o' the fence to figure in. That'll make a strip o' land four foot wide that you can't use. You take the len'th o' your fence an' see how much that comes to at $30 an acre.

"Sim 'ud stop right there an' send Bill off to harrer or suthin' while he'd go into the house an' put in the rest o' the day figgerin'.

"That's how Sim was about everythin'—politics, religion, temp'runce, horse tradin', food for his stock an' food for himself an' gals an' curing hams an' hail insurance an' the race problum an' bone fertilizer. Sometimes somebuddy 'ud change right over an' take the op'sit views. Finerly he got married."

"How did he make out to settle on the woman that he wanted?" asked Hank Tulliver.

"Well, that's suthin' a feller don't allus settle on himself," replied Hancock. "Seems like Sim's woman done the settlin'. Sim was kind o' sochuble, an' one night he was callin' on her an' he allowed that he wasn't right sure whether a feller wasn't better off single than he was married.

"'Well, you take my word for it this time,' she says. "There's some that's better married an' you're one o' that kind.'

"'Mebbe you're right,' says Sim, 'but who'd I marry? I've though of it, but I dunno as there's any woman around here that 'ud suit me.'

"'You don't need to go no further than this place,' she says, 'I'd suit you first rate, an' I'm willin' too, so as your buggy's outside an' the preacher is over to his house we'll jest hop right in an' drive over there.'

"Well, she put on her bonnet while he was studyin' on it an' the next thing he knowed he was in the buggy with her. After a while he says to her, 'How do you know I'd suit?'

"'I've thought of that, Sim,' she says, 'an' I've come to the conclusion that it's because your idees is jest the same as mine. You're a hardshell Baptis' now an' forevermore an' nothin won't never stir you the width of a rat's whisker, an' so am I. You're a rock-ribbed, dyed-in-the-wool dimercrat with no leanin's tords them popyerlists or republican mugwumpses an' will be till the day you die, an' me an' my folks have allus been the same. You hold with a man makin' up his mind an' a-stickin' to it, whether or no, 'ceptin' when his wife might objec,' an' that's me. Ain't that all so?'

"'I guess it is,' says Sim.

"'You bet it is,' she says. 'Now, you get out an' hitch en' then he'p me out. An' I want to tell you that if you ever have any doubts about anythin' from this time on, you come to me an' tell me an' I'll make up your mind so quick it will make your haid swim."—Universal Magazine.

## THE DIGNITY OF LABOR.

There are many people who are rich and have others do their work for them, but the majority of us have to work with our hands, and the day will come when the man or the woman who works with his brains alone will be considered only half educated. There are many rich people who work harder than poor ones. Life is like one great carpet, and some of us have to weave the dark body threads and others put in the gay ones. We could not have our carpet without the body threads just as we could not have the world as it is today without the workers. They are the backbone of our nation. It does not matter what kind of work we have to do so long as we do it well. The woman who goes out washing by the day is doing fine, honorable work, if she does her work thoroughly and takes just as much interest in other people's work as if it were her own. If you do your work well, it shows what kind of a workman you are. Some women think they are paid to do work and that they must only do what they are paid for. The woman who gets ahead is not the woman who stops because the clock strikes six. Our life and our character are affected by the way in which we do our work. If we know how to do our work well and do it in a careless and slighting manner, that habit grows very quickly, and after a time we lose the capacity to do our work in the best way. You can make your work dignified no matter what the work is. If you are ashamed of your work, the work will never be done right, and you can never be a happy person. We must do our work well, and we can make our work and our life what we will. There is no more glorious work for women than that of housekeeping, and the woman who makes a home, prepares the meals, washes the dishes three times a day, and makes the clothing for the little children is the woman who is entitled to all honor and glory. The woman who is her own housekeeper and mistress can so dignify labor that housekeeping will be considered the finest kind of a profession. Half the battle in any field is to love the work we have to do today, and do it well. Do not envy other people, but be satisfied with what you have.

Every mother should see to it that her daughter is inspired with the art of good housekeeping and feels that when necessity arises she can do her own work without feeling that she is doing anything which lowers her dignity.—Mary F. Rausch.

## TO TAKE MILDEW FROM CLOTH.

When the mildew is deeply imbedded in the cloth, chloride of lime can do the trick. Put a heaping teaspoonful of it into a quart of cold water, stirring it well with a wooden spoon until thoroughly dissolved; then strain it twice. Immerse the mildewed article in this solution and work it about with a wooden spoon, not touching it with the hands but leaving it in the water until the mildew seems to have disappeared; then lay it in the sun and when it is dry, if the spot is still visible, repeat the operation until it has faded entirely out. Afterward wash in a tub of cold water changing the water once. This will not do for colored cloth as chloride of lime, a pound of it, with the addition of a large spoonful of salsoda in a pailful of soft water will bleach the color out of anything left in it 15 minutes. Rinse thoroughly, afterward drying in the sun."

For lighter mildew stains we mention the soap and chalk remedy which the most of us have tried with good success.

Oxalic acid will remove iron rust. A strong solution is used to wet the spots and then they are laid in the sun. Repeat if necessary. The oxalic acid is poisonous and must be handled with care. A little ammonia in the second rinsing water after using acid will help to take it all out of the cloth. Sometimes when these bleaching agents are used there will be a slight stain left from the mildew; iron rust or other stains generally disappear if the stained cloth is boiled in pearline suds and rinsed with the regular washing.

## RECIPES.

**Noodles for Soup.**

Break one egg, sift and stir in half a cup of flour and a saltspoon of salt. Knead and roll as thin as possible on a molding board dusted with flour. Let this stand five minutes, then roll up loosely. With a sharp knife cut thin slices from one end and let these curls of dough lie on the board for about half an hour. Have some boiling, slightly salted water; drop in the noodles and cook 25 minutes. Drain well and add to hot soup or beef broth.

**Baked Ham.**

Choose a small ham and trim it neatly. Then wash well and put it in a pot of boiling water deep enough to cover. Let it boil for about three hours or until the ham is tender. Take from the water, loosen the tough outer skin at one end and pull it off. Score the top of the ham with a knife in deep parallel cuts, stick full of cloves and pepper well with black pepper. Set in a hot oven and bake brown, basting frequently with a cupful of vinegar in which three tablespoons of sugar have been dissolved.

## WATERMELON BOOTH FOR A SUMMER FAIR.

The feature which scored the greatest success at a summer-resort fair was a watermelon booth, the bright invention of an artist sojourning at one of the hotels.

The booth was hung with festoons of red and green tissue-paper and decorated with piccaninny heads cut from black paper, with features painted in water-color.

Big slices of watermelon at ten cents a slice were served by one of the ladies interested, blacked and bandana-ed to represent a portly Southern mammy. The "watermillion," owing to the warm weather and the novelty of it, took like the proverbial hot cakes.—Woman's Home Companion for August.

## BY DEGREES.

A maiden at college named Breeze,
Weighed down by B. A.'s and M. D.'s,
Collapsed from the strain.
Said the doctor: "'Tis plain,
You are killing yourself by degrees!"
—Success Magazine.

# California Genuine Sardines

## Not a Substitute, but a Genuine Sardine

They have all the old time Sardine qualities. Delicious in flavor, a wholesome, nutritious food. You will prefer them to any you have ever eaten.

**PROFESSOR DAVID STARR JORDAN,** President of Leland Stanford University The leading authority on fishes of the Pacific Coast, writes of the California Sardines, in "Fishery Industries of the United States," 1894, page 569: "This species is everywhere known as the Sardine or by the Italians as Sardinea." It is in fact almost identical with the sardine of Europe.

### Your Only Protection

against substitution lies in becoming acquainted with our brands.

### Don't Ask for a Can of Sardines or California Sardines

But ask for any of the following brands and insist upon getting them:

### Put Up Only Under These Brands

| BRANDS | STYLES | BRANDS |
|---|---|---|
| Goldfish | Ravigote | La Rouchelle |
| Sunset | Le Croix | Mission |
| Senorita | Boneless | Sunset |

If your grocer does not carry them in stock write us.

CANNERY, SAN PEDRO, CAL.
The only Cannery of Genuine Sardines in America that is operated 12 months in the year in the same line of business.

| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

Receipts of hay during the week have been 4000 tons. There is more hay coming in by water now than we have been receiving by water since last summer. The arrivals by railroads have eased off somewhat, as many of the farmers have thought that the prices that prevailed on this market were not in keeping with conditions as they view them; consequently they have held off shipments for a while.

There has been practically no hay, to any extent, change hands in the country recently, as there is a large difference between the ideas of prices between the farmers holding the hay and intending purchasers. Small lots for prompt shipment have been purchased, but nothing to amount to much, or to attract any attention, and not enough to have any effect on the market one way or the other.

The market here in San Francisco during the week has not changed to any extent. Prices on fancy hay of any kind have been well maintained, but there has been a decidedly weak feeling shown on all offerings of medium and poorer classes of hay. Consumers here have become so used to having good hay for the last two years, that they do not want any off grades, and will not purchase except at a low figure, these types of hay; therefore the medium and poorer classes of hay have dragged badly, and returns have been unsatisfactory to shippers.

Alfalfa hay is arriving in large quantities, and while the market is not definitely lower, there is, however, a feeling of weakness throughout the entire line. Many consignments of No. 2 hay have been sent in from various sections, and returns on such grades have not been up to the expectations of the shippers.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 17.50@18.50 |
| No 1 wheat or wheat & oat | 16.00@17.00 |
| No 2 wheat or wheat & oat | 13.50@15.00 |
| Choice tame oat | 16.00@17.00 |
| Other tame oat | 12.00@14.00 |
| New crop wild | 11.00@14.00 |
| Stock hay | 8.00@9.00 |
| Alfalfa | 10.00@13.50 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.65@1.75 |
| Barley | 1.30@1.40 |

| Shorts | 31.50@33.00 |

## Citrus Market

LOS ANGELES, Sept. 8, 1909.

If anything the Valencia market is somewhat stronger than last week, though it is somewhat embarrassed by the excess of small off sizes. With little question the season will close without any record breaking prices, but a fair return for everything yet to go is confidently expected.

The cooler weather has somewhat depressed the lemon situation, but with the very limited number now going forward, and the limited receipts of foreigns, fair returns are expected through the season. Only about ten or a dozen cars are shipped daily.

### Shipments.

Total shipments of citrus fruits to date this season, 36,189, of which 30,301 were oranges and 5,888 lemons.

ST. LOUIS, Aug, 6.—Hot. Market weak on oranges, higher on lemons. Six cars sold.

| LEMONS— | Avge. |
|---|---|
| Princess, Q. C. Exx., Corona | 3.10 |
| Matador, A. H., Prenda | 1.05 |

## NEVER FORGET.

That the fairest flowers fade soonest.

That knowledge leaves no room for chances.

That pride is never so offensive as when in chains.

That a sealskin sacque does not always keep the heart warm.

The darkest cloud often contains the most fruitful showers.

That an open enemy is to be respected, a secret one to be suspected.

# Legal

Edw. L. Payne, attorney, 301-304 Douglas Bulding, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

### Diverting Water from Proper Owner.

A and B buy land in an irrigation district, the land owning the water. B buys on a different lateral. Owing to a shortage of water can directors of said district vote the water from A's lateral and give it to B, B refusing to use water during period of heavy run, A's crop at present time suffering from lack of water owing to improper distribution of water in A's lateral?—Subscriber, Modesto.

No, unless there is some provision for such a condition in the by-laws of the company.—E. L. Payne.

### Railroad Company Liable.

When a railroad takes land for right of way and cuts down for grades to suit them, what is done to keep land of former owner of said right of way from caving, and who bears the expense?—Subscriber, Glendale.

The railroad company is liable in damages to the owner through whose land the cut runs if the land of the owner is caused to cave by any carelessness or negligence on the part of the railroad company, or by virtue of the method of constructing the road, and the Company should adjust the matter upon demand by the owner.—E. L. P.

# Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Pin Worms.

Please give me through the columns of your paper a remedy for pin worms in horses—Subscriber, Pasadena.

Turpentine three ounces, aloin one ounce, cottonseed oil one pint. Mix and give at one time. If the horse does not physic well in two days, repeat Give several (five or six) enemas of strong salt water solution.—R. T. W.

**DR. WHITTLESEY'S VETERINARY REMEDIES.**

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

## THE GUILTY PARROT.

Mrs. Carrie Chapman Catt, the well known suffragist, while she hopes she gives due credit to the noble being, Man, does not, on the other hand, overestimate the lords of creation. She was speaking recently of another prominent woman who is somewhat lukewarm in the suffrage cause.

"The trouble with Mrs. Blank," said Mrs. Catt, "is that she fairly worships her husband. She thinks that he is absolutely perfect. Why, the woman actually believes that the parrot taught him to swear."—Woman's Home Companion for September.

## STATE FAIR.

(Continued from Page 259.)

hibit is greatly heightened by these improved conditions. Certainly we have never seen a larger or better exhibit of birds brought together.

### Overflow.

Owing to shortage of house room, many of the exhibits were made in tents. These were in the nature of overflow exhibits, and one tent was devoted to automobiles, of which there was a large number and of all varieties. It was an encouraging sight to notice that many farmers exhibited a decided interest in this display and asked numerous questions about the machines, many of which indicated that they were not tyros in the use of these new vehicles.

### The Track.

The Speed trials, divested as they were of the gambling features, did not attract the attention that they have done in the past, that is, the whole fair was not subordinated to the horse races, but despite this fact there were some good running matches and these were generally well attended.

### Bar Maids.

There was one discordant element in connection with the fair this year. In extending invitations to the various manufacturers and producers of the state to participate in the exhibit, an invitation was extended to the Winemakers' Association and accepted by that body. A beautiful booth was erected, handsomely decorated and fitted up with tables and chairs. It was determined to deal out samples of California wines to all visitors, and to make the exhibit more attractive, several young ladies, dressed as European bar-maids, were employed to serve the wine. The whole was attractive, without a doubt, but the proposition of giving out free drinks at the state fair aroused the W. C. T. U., and the temperance people of the state and a strong protest was entered against it. It was too late to recall it, however, and to even up matters, a space was given to the W. C. T. U. people in the gallery almost immediately above the wine display, and here a booth, covered with scriptural mottoes against drinking was erected and while wine was being served in the lower booth denunciations against its use were hurled from the upper booth. Very many people visited the temperance booth and congratulated the good women having it in charge on the work they were doing, but the wine booth was crowded all the time.

### Reduced Attendance.

There was a fairly good attendance at most of the sessions, but on the whole the fair was not so largely attended as in former years.

Several causes can be adduced for this, the lack of proper buildings the unfinished condition of those already erected, the rough nature of the grounds and lack of other attractive features. Seeing that all the work on the buildings has been done in the past few months, and almost the past few weeks, the management deserve praise for what they have done, and by the time another fair season rolls around it is probable that California will have one of the finest fair grounds in the country.

Large areas of marsh land have been reclaimed near Marshfield, Oregon, and sold at the rate of $100 per acre.

# Business Notes

### RESULT OF A LITTLE AD

The following letter is self-explanatory. It raises a question of interest to many readers of the paper. All over the state there are scores of people who have things to sell to those who wish to buy. The Liner department of the Cultivator is the easy method of communication. The cost is nominal. Only a cent and a half a word, no charge less than 25 cents, but brings the seller and buyer together at once. Read Mrs. Hart's letter and profit by her experience.

"I do not understand why the small farmers do not make more general use of your columns to advertise and save the middlemen's profit. Last year one small advertisement sold all the Newtown pippins I had, more than 100 boxes. Many who ordered, duplicated their order as soon as first lot of apples was received by them.

"Please insert enclosed adv. in your next issue. Enclosed find 25 cents to pay for same. Mrs. John Hart, Watsonville."

### A HOT ONE FROM CHILE.

The following letter from E. E. McClanahan one of the Cultivator's pleased patrons, explains itself. Mr. McClanahan is one of our large advertisers. He furnishes bright, snappy copy well illustrated; the Cultivator does the rest:

Aug. 23, 1909.

California Cultivator,

Gentlemen:—It might interest you to know that through my ad. in your paper for Success Fireless Brooders, I have on file an order for the 150-chick size from F. Robinson, Santiago, Republic of Chile. It takes the Cultivator to bring the orders from all corners of the earth.

Yours faithfully,
E. E. McCLANAHAN.

## QUERIES.

(Continued from Page 258.)

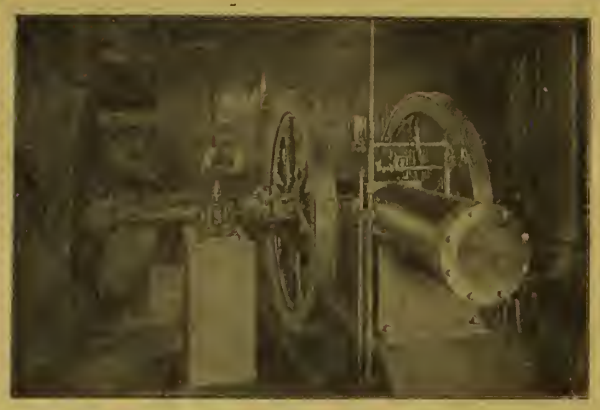
I wish I could call the cows up to say what they think of sorghum as feed! The only thing about sorghum is to begin to feed it slowly and a little only until the cows are accustomed to eat it. The seeds do no harm, but the cows will eat the sorghum up clearer if it is cut when the heads begin to burst out before the seeds form. Cut the sorghum above the first nodes or joints and it will sprout again and can be cut as soon as it is tall enough. I prefer to cut it when it heads to letting it grow longer. It cures readily when spread on dry land away from the cornfield. It makes excellent hay and will keep readily all winter. We begin to cut the sorghum when three feet high and keep cutting it each day, feeding it green to the cows and drying the surplus to feed when the green is exhausted.—M. E. S.

### Nut Grass.

Is the grass which I send with the little bulblets or nodules, Johnson grass? What is the best means of getting rid of it or preventing its getting into my orchard?—W. A. A., Cucamonga.

This is not Johnson grass, but as near as can be determined from the limited specimen is nut grass, cocoa grass, or cyperus rotundas. Like many other weed pests the only sure way to control this is by thorough and persistent cultivation. At each cultivation or weed cutting be sure that none of the little "nuts" or bulbs, or any piece of the root are dragged from one part of the field to another. It is a troublesome pest, but may be disposed of by thorough work.

Sacramento Valley is shipping alfalfa hay to Humboldt Co.



60 H. P. Western Pumping Plant

# A Frequent Mistake

made by engine buyers is to suppose that one engine is as good as another, the only difference being in the price. Certainly, many engines can be bought for less money than the WESTERN and this fact sometimes leads the prospective purchaser to the conclusion that to buy a low-priced engine will be an economy. This is not so. The one essential of an economical engine is that it shall give the maximum service for the minimum expenditure. If it is cheapened to a point where it fails to do this, **any** money put into it is an extravagance.

In the WESTERN every detail of design and construction has been to reduce the fuel and maintenance cost to the lowest possible figure. That we have succeeded is being constantly proven where our engines are installed alongside other makes, doing the same work, under the same conditions, developing **more** power, with **less** fuel.

# Lemon Growers Have a Day of Profit and Fun

## The Lemon Men's Club of Southern California Meets at San Fernando and Enjoys the Day and Discusses the Future of the Industry

"WILL lemon growers be permitted to secure the benefits from the one and a half cent lemon tariff, or will they be taken by the railroads," was the question which, though somewhat tempered down from these words, was put by members of the Lemon Mens' Club of Southern California to representatives of the two big transportation lines, who were present at the meeting of the club at San Fernando last Saturday, Mr Jno J. Byrne of the Santa Fe and Mr. T. A. Graham of the Southern Pacific.

### No Dullness.

This meeting was one of the most important held by the lemon mens' club and called out a representative attendance from every section of Southern California. Its object was to have a rousing good time, and the motto of the day seemed to be, "All work and no play makes Jack a dull boy." The train which brought a greater number of the members from the south arrived about eight thirty and was met by the lemon men of San Fernando Valley who took the visitors on a sight seeing trip to representative orchards.

### A Lemon Squeeze.

The gathering at which this question was put to the representatives of the railways was held under the big trees at the home of Mr. and Mrs. C. D. Hubbard, and was for the purpose of perusing a most attractive bill of fare and testing the excellent cooking of Mrs. Hubbard. Nearly three score of tender white Wyandottes gave up their lives to make the feast To use an expression of the day, "They were handed a lemon." In fact, the entire meal was on the citrus order. It was a lemon squeeze in earnest from the soup which was served in the hollowed out half of a lemon rind, olives likewise served in lemon "dishes," lemon salad, lemon pies, to the strongest drink served at the banquet, which was tinged with the lemon juice.

While the visitors were enjoying this banquet Mr. C. C. Teague of the Limoneira Co., of Santa Paula, President of the Club, called for order and announced that as the time was to be so taken up with auto trips and practical demonstrations of methods in the orchards, instead of waiting, as usual, till the close of the feast for the speaking, he would ask the speakers to forego their chicken for the time being and address their remarks to the others while the banquet was in progress.

### California Can Supply.

Mr. A. F. Call of Corona referred to the efforts of the committee which was sent to Washington by the lemon growers of California to secure an increase in the lemon tariff. He gave to Senator Flint much credit for the work which was accomplished. However, we noted through the assembly many warm expressions of commendation for the work of Mr. Call and his committee. The main point in Mr. Call's talk, and perhaps the principal thought of the meeting was to emphasize the necessity of greater care in growing, in picking and packing the fruit. No matter how high a protective tariff shall be given to us or how low a freight tariff, indifferently packed fruit or low grade fruit can only bring disaster to itself and to other fruit of better grade from the same sections. Mr. Call said that of the 12,000 or 14,000 cars of lemons necessary to supply the United States California is producing only about one-third. This is the first year that the output has ever exceeded 5000 cars. With the present lemon tariff and the quality of fruit which it should encourage growers to put up, the lemon production should be doubled within a very few years. One attendant at the club meeting remarked that the present acreage in lemons in California, if given the right kind of care, could easily be made to double the present output. This does not consider the young trees yet to come into bearing or yet to be planted. Mr. Call asserted that without question, California has the capacity to supply the entire United States with every lemon it needs. He paid a high tribute to the California fruit growers exchange which as a co-operative marketing proposition is not equalled in the world.

Judge Hutton of the Superior Court of Los Angeles County gave a tribute to the San Fernando Valley and its business, saying that "There is an opportunity for every man with two strong hands who will intelligently study the lemon industry, particularly when the transportation lines do as much for us as Congress has."

### Scientific Investigation.

Prof. A. J. Cook of Claremont presented the matter of securing the help of an expert from the Department at Washington along the line of fertilizing, that is, in scientific investigations into the needs of the soil under California conditions. He referred to the fact that the University has for the past few years been conducting experiments along that line, but that the question was so important that the Department should give us further aid in the matter. Professor Cook referred to the grand work of Messrs Powell, Woglum and others, also to the fact that Mr. Shammel of the Department is now taking up the matter of improving quality of citrus fruit by selection and breeding The only reason advanced by the Department why this work should not be taken up was that California has already received freely along this line of investigation But the need is great and if the help can be secured, no effort should be spared toward getting it. He closed his remarks by making a motion that a committee of three be appointed by the chairman to draft resolutions and forward to the Department to secure, if possible the appointment of such an expert.

In the matter of the freight tariff there was no particular discussion other than that the representatives of the railways both assured the lemon growers that the industry would be justly dealt with.

"The lemon industry is one of the greatest likely to be developed in California, and while the tariff may help it, the great secret of success, as has been demonstrated by Mr. Powell and his assistants, is to do our work well, to handle the fruit carefully and methodically and study our conditions. This is the great secret of putting our oranges and lemons on the market sound and is more important than any other one thing." These sentences give the substance of the remarks made by Mr. E. A. Chase, head of the National Orange Co. of Riverside. Mr. Chase knows whereof he speaks in the matter of care in the packing of fruit. He has been one of the closest followers of Mr. Powell's methods, and the prices his fruit has secured in the market are a strong recommendation in favor of care in its handling. While orange groves are the principal part of Mr. Chase's holdings in the Riverside section, he has also 200 acres of lemons on the side.

"Colonel" J. A. Reid recently returned from Florida with the glory of a newly acquired title, gave a few points regarding the organization of the citrus interests of Florida. Mr. Reid's remarks will be given more at length in next week's Cultivator.

### Might Ride in his own Auto.

Mr. H. C. Hubbard incidentally remarked that if he had begun raising lemons many years ago when he began raising wheat he would now be riding in his "own automobile instead of that of Los Angeles County." Mr. Hubbard had been the guest of Mr. Dingle in the County machine during the forenoon.

### In the Orchards.

After the banquet many of the members of the Club visited the orchards of Messrs. Reynolds, Wilkinson, Bartlett, Huff, Meyers, Hubbard, and the Mission Land Co., and discussed methods of working especially manner of pruning. Liberal criticisms were made on methods of pruning but, of course, it was admitted that it was a matter in which there was room for difference of opinion. The orchards surely showed a fine lot of fruit, sound, and some ready for picking. The orchardists in question had made efforts in the past to improve their soil conditions by green manuring, but owing to the trees being so large indifferent growth only had been secured. Stable manure was preferred where it could be had.

### The Ride.

The autos during the forenoon had taken the visitors to the large Ford orchards where they viewed 185 acres of as beautiful orange trees as one ever saw. The water for the irrigation of the entire 185 acres is lifted 130 feet. As was remarked by one of the visitors, "An orchard that was given only ordinary care could not stand the expense of such a lift of water, for indifferent care would surely bring indifferent results." The pumping plant in use is entirely up-to-date, a steam plant with the ordinary deep well pump head with an additional steam pump at the surface of the water. The Tom Walker lemon orchard was also inspected. It was being irrigated at the time by the furrow system, the water being lifted by gas engines. This orchard, now in its fifth year was remarkable because of the size and thrift of the trees.

One station of the trip which was interesting to all was the plant of the Los Angeles Olive Growers Association which puts up the famous Sylmar olive oil. It was indeed most complete from crusher to presses and the large glass lined tanks with a capacity of 40,000 gallons. These are now full of last year's crushing which will soon be pumped out, run through filters and bottled for next year's business.

The beautiful homes of Messrs. John Burr and F. L. Boruff were both visited.

# Citrus and Sub-Tropical Fruits

## FUMIGATION DOSAGE FOR THE PESTS OF CITRUS TREES.

There appears to be a misconceived idea among a number of people interested or engaged in the practice of fumigation regarding the use of my Dosage Schedule I. (printed in Cultivator of August 19.)

This dosage schedule in itself must not be considered as the most suitable strength to use for all the different species of citrus scale pests, at all times of the year, or in all localities in Southern California in which citrus fruits are produced. For a single table to meet all these requirements is an impossibility. A dosage which will result in satisfying execution of the red scale will not produce as good results against the purple scale, while the mealy bug is even more difficult to destroy than either. Moreover, a dosage which will destroy a certain species of scale near the coast probably will not produce as satisfactory results against the same species in the warmer interior valleys as at Redlands, Riverside, etc., where the atmospheric conditions at night are generally much less numid.

The intention of Schedule I as stated in numerous discussions and published articles on fumigation is that of a basic or fundamental dosage; a schedule which, if not suitable in itself for a certain scale under certain conditions, is so prepared as to allow the easy and accurate preparation therefrom of other schedules of dosage strength to meet the desired conditions. If Schedule I is heavier than is required for a certain scale pest under certain conditions, that schedule can be easily reduced to any strength desired merely by reducing each dosage number in Schedule I at the same rate, say ⅛ or ¼ or 1-3, etc.; if Schedule I is not as heavy as is required it can be changed to meet their requirements by increasing the schedule after the manner just mentioned. Thus we see that Dosage Schedule I can be so manipulated as to produce a schedule of any strength desired, the great advantage being that the resulting schedule will also be one of uniformity so far as results in the field are concerned. Dosage Schedule I in itself, however, meets more requirements and can be used probably more generally than any other single dosage strength.

### Purple Scale.

For lemons, Valencia, navel and seedling oranges I would advise Schedule I in use against the purple scale in all regions in this state where this insect occurs. The preferable time for fumigation is from about the middle of August to November. It can also be carried on safely at other times except when the fruit is of small size. For discussion of this subject see Bulletin 79, United States Bureau of Entomology. This Bulletin entitled "Fumigation Investigation in California can be obtained by writing Chief, U. S. Bureau of Entomology, Washington, D C St. Michael and Homosassa are frequently burned to some extent unless the dosage is decreased. It is a disputed question in the case of these two varieties whether to decrease Schedule I by ¼ to avoid burning, or to use full Schedule I, holding that the loss from burned fruit is more than offset by the extra amount of scale destroyed by the heavier dosage.

### Red Scale.

For red scale in the citrus growing regions near the coast Schedule I can be decreased ¼; or, in other words a ¾ schedule will destroy the red scale in this region. The three-fourth schedule might possibly be inadequate in the dryer interior valleys, the full No. I schedule being required. Experiments are in progress at this time to settle this particular point.

### Black Scale.

The dosage used for the black scale depends upon the condition of the scale. While young and soft, a ½ schedule, or Schedule I decreased ½ will prove satisfactory. After they are grown and become leathery a full Schedule I is required.

The above recommendations are for the character of tents in general use in Southern California. Oiled tents, or tents treated with concoctions which make them very much tighter than the untreated duck or drill require a decrease from the above. Such tents are at present very few in number.—R. S. Woglum, Special Agent, U. S. Bureau of Entomology, Whittier.

## COMPOSTS AND COMPOSTING.

Frequent requests are made for compost formulas, and the following one, with barnyard manure, rich dirt, or woods mould, or all, and acid phosphate and kainit, is well suited for general use:

| | |
|---|---|
| Barnyard manure, rich dirt or woods mould | 1,750 pounds |
| Acid phosphate | 200 pounds |
| Kainit | 50 pounds |
| | 2,000 pounds |

With average barnyard manure the above compost would contain: phosphoric acid, 1.7 per cent.; potash, .7 per cent., and ammonia, .6 per cent. One ton of this compost is worth between 500 and 600 pounds of the average fertilizer containing 8 per cent. of available phosphoric acid, 2 per cent. of potash and 2 per cent. of ammonia. It should be applied at the rate of 600 to 1,600 pounds per acre in the drill, 1,400 pounds of the compost being about equal to an application of 400 pounds of the 8-2-2 fertilizer.

The compost may be made under shelter or out of doors. In either case select a place where the soil is compact, and arrange it so that the water that may run through the heap will not drain from it. Put down the materials in alternate layers—first, a layer 3 to 6 inches thick, according to the size of the compost to be made, of the manure, woods mould, or rich dirt, then sprinkle upon this layers of acid phosphate and kainit, and continue in this way to put down alternate layers of the materials till the compost is complete. If dry, the manure, mould, etc., should be moistened by sprinkling with water, and the heap should be brought to a conical or wedge shape, covered with dirt, preferably rich dirt, and thoroughly compacted to prevent undue

entrance of air, which brings about heating and injurious fermentation of the heap. The compost must be watched, and if it becomes hot a hole should be made in the side and towards the top and water poured in to cool it. Heating is likely to occur if made under shelter, while if made out of doors in the winter and early spring the rains are apt to be sufficient to keep it moist, but here there is danger of loss, especially of the very soluble potash and phosphoric acid, from leaching, and the heaps made out of doors need careful watching to see that they do not get too hot just after making and between rains, and more especially to see that they are thoroughly covered with dirt and compacted, so as to make the water run mostly off the sides instead of through the heap and draining off with the most valuable part of the manure. The heap should remain 40 to 60 days, and may stay longer. Before using, it should be thoroughly cut up and mixed by means of hoes and shovels. If the manure, woods mould and dirt are reasonably free from litter and trash, the mixture may be put through a sand screen and be in condition to drill as other fertilizers are. This will require care in selecting the manure, mould and dirt.

Unquestionably, there is great advantage, if it is not, indeed, an absolute necessity, to save scrupulously all the manure and other waste material on and around the farm to assist in maintaining or increasing its productiveness. One way to do this is to use the compost in some way similar to that suggested in the foregoing. Another and perhaps somewhat cheaper way, unless the compost is made at a time when the farm labor is not profitably occupied with other work, is to apply the manure and woods mould, etc., broadcast where there are large quantities of them, or in the drill when the amounts are limited and less than 1,500 to 2,000 pounds to the acre, and drill the acid phosphate and kainit or other materials on them. This saves the cost of mixing. Each plan has its advantages, and each farmer can decide for himself which best suits his individual case and which will enable him to save to best advantage these exceedingly important and valuable fertilizer materials on and about the farm and which go to waste, or partial waste, in far too many instances

**Use Lime in the Compost.**

Where lime is used at all in the making of compost, it should not be put in contact with either the barnyard manure or acid phosphate, as it has an injurious action on both of these, endangering the loss of ammonia from the manure by setting it free and enabling it to pass off in the air, and changing the phosphoric acid of the acid phosphate into an insoluble form. Where sour muck or black soil is used, the lime mixed with these would correct their acidity or sourness and prove beneficial.

## HAWAIIAN NOTES.

A letter from Mr. W. B. Thomas a few years ago an owner of the Cultivator and now a fruit grower in Wahiawa, Hawaiian Islands, sends the following interesting items:

As you are no doubt aware, there are not many engaged here in farming as it is practiced in the states, but the number of cultivators of small tracts is growing.

The strike among the Japanese laborers that has been going on for three months was broken last week by the strikers going back at the old prices. No concessions were made by the planters. The latter, however, are alive to the fact that they have heretofore depended too much on Japanese, and agents have been sent to Portugal and Russia to recruit men from those countries. A special income tax was levied by the territorial legislature last winter to raise money for the purpose and already a fund of $85,000 is available.

The pineapple harvest is now on and the crop is large and the fruit fine. The canneries are all running to their full capacity. Wahiawa is now the center of about 6000 acres of pineapples.

The advertising that is being done in the magazines is returning good results, and it is proposed to continue it indefinitely at the rate of $50,000 to $75,000 a year.

The growing of tobacco and cotton looks attractive to a good many here now and it would not surprise me to see both these industries take a prominent place in island agriculture before many years. Tobacco is past the experimental stage, but it will take another year or two to tell positively what can be done with cotton on different kinds of soil, elevations, etc.

Jared G. Smith, who for ten years was the head of the U. S. Experiment Station here, last year resigned his position to go into tobacco raising. Mr. Smith started the tobacco experiments made by the Station, and has lots of faith in the business. His plantation is at Kona, Hawaii, and will this year produce over 50 tons of fine tobacco.—W. B. Thomas.

During the fiscal year 1907-08 the following permanent improvements were made in the national forests. Thirty-four hundred miles of trails, 3200 miles of telephone line, 100 miles of wagon road, 40 miles of fire line, 250 bridges, 550 cabins and barns and 600 miles of pasture and drift fences. In addition to the sum provided by the special improvement fund, over $100,000 from the general fund of the service was turned from current expenses to defray the cost of this work, but much of the work planned and urgently needed could not be carried out because there was nothing with which to pay for it.

"John, you're just the man I want to talk to. You know I'm going to build a new barn. And I don't want to make any mistake about the roof. I had too much trouble with the old roof. Always needing repairs. I guess there wasn't a year that I didn't have a lot of spoiled hay or something, on account of those everlasting leaks. This time I want a roof that won't leak like a sieve, and that'll last awhile'.'

"Well, you can take it from me, Tom, Rex Flintkote is in every way the best roofing you or anybody else can get. After fifteen years my roof doesn't show a single sign any place of being any the worse for wear. Never cost me a solitary cent for repairs."

"Well, you've put it pretty strong, John. Now, what I want to know is *why* Rex Flintkote Roofing is best. You know there are two or three other roofings that are claimed to be the Best-in-the-World."

"Listen. You see Rex is made of long-fibre wool-felt. Now, wool-felt is something that lasts like eternity. Look how a good 'slouch' felt-hat wears—forever, almost. Then this hard-packed wool-felt is thoroughly saturated and impregnated with a special compound that protects against decay. Rain can't soak through that combination—the sun can't soften it—and it's proof against the action of the oxygen in the air, and all those things that so eat the life right out of other prepared roofings."

"That's good, John; now how about fire."

"Send for a free sample. Try it with a live coal of fire—prove for yourself that Rex Flintkote won't catch fire. Just write to the manufacturers. They'll also tell you just what dealer to go to. And they'll send you free a mighty good book about roofing. Remember, look for the Boy trademark on every roll. Better write to-night, Tom, before you forget it. Here's the address:

## UNFERMENTED GRAPE JUICE.

OWING to repeated requests we reprint the following which was written by Mr. Mills for the Cultivator of September 12, 1907:

Unfermented grape juice is a refreshing and nutritious beverage that may be had by all farmers who have a few grape vines. There are several large grape juice factories in California, in which much special machinery is used for the purpose, but for the farmer who wishes to put up a few gallons, this is not necessary. By following a few simple principles the work can be satisfactorily done.

### Extracting the Juice.

Grapes that are fully, but not overripe, are selected, thoroughly washed in clean water after removing any parts of bunches that may be decayed. If an ordinary fruit press is at hand, the grapes may be ground and pressed through that. Not having this, place the grapes in an open vessel and crush with a potato masher. It is better when making a small amount of juice to pick the grapes from the stems. After the grapes have been well crushed, put them in a cotton bag of rather loose web and extract the juice by twisting. If the weather is cool, it may be hung up and allowed to drain over night. A colander may be used by placing a plate on top of the bag and a heavy weight left on over night. Place the colander in an earthen dish.

### Filling and Sterilizing.

Fill quart fruit jars, if nothing in glass jars is at hand, to within an inch of the top; place in a wash boiler with a wooden rack in the bottom so as to keep the jars off of the metal bottom, fill with warm water to within an inch of the tops of the jars and heat till the temperature is 185 degrees Fahr. Have the metal tops of the jars in a pan of boiling water ready to put on the jars. Place over the tops of the jars circular pieces of filter paper which can be bought at any drug store, and screw the tops down over them. Two papers on each jar should be used. Set the jars away in a cool place for a couple of weeks when the sediment will have collected in the bottom.

### Clarifying.

If it is desirable to bottle instead of putting the juice in jars, fill the bottles within an inch of the point below where lower end of the cork will be when inserted. Place the jars in the wash boiler as indicated above. Be sure to have the wooden bottom in the boiler. Heat the water to 180 degrees and allow it to stay at that temperature for twenty minutes. Have new corks handy in a hot parafine bath, take them out with a pair of tweezers and place them in the mouth of the bottles before taking them out of the water. The bottles must be removed from the hot water immediately after inserting the corks or they will be forced out by the generation of the steam. The corks should be forced into the bottles at once and resealed with a light painting of hot paraffine. This will so completely seal the contents of the bottle that there will be no possible chance for it to become inoculated with the elements of fermentation.

Should fermentation take place later on, it will have come from bacteria already within the juice or bottle.

Where the grape juice is for home use entirely and the presence of sediment is not objectionable, the second heating is not necessary, though it is much safer. The fungus spores that are in the liquid may not all be killed at the first heating and the second time they may be in a more susceptible condition when the heat will exterminate the last of them. When a clear juice is desired, it is necessary to heat twice. After heating the first time and allowing it to settle as described above, drain off the liquid and be sure not to allow it to get as hot as at the first heating or another lot of sediment will be deposited.

### To Give Color.

Zinfandel makes one of the best unfermented grape juices. Some of the sweeter kinds are sometimes used but they soon cloy while the more acid sorts do not. Most black and red grapes have a clear juice. If it is desired to have a colored juice a few skins of a black variety heated to nearly boiling will give a red juice that will give good color. There are several varieties of grapes that have red juice. Alicante Bouschet is, perhaps, the best. Manufacturers of unfermented grape juice pay an extra price for these grapes for coloring purposes.

## HOW TO OBTAIN MORE UNIFORM AND BETTER COLORED APPLES.

A large proportion of the poorly colored fruit from old orchards is caused by dense-headed trees and close planting, which prevent the free access of air and sunlight and delay the maturity of the fruit in the fall. The fundamental corrective in such cases lies in judicious pruning by means of which the fruit may be exposed to the sunlight.

In other cases the poor color may be due to a combination of heavy soil, tillage, frequent turning in of nitrogenous cover-crops, spraying, and neglect in prunning. These conditions stimulate the trees to active growth, the foliage increases in health, size and quantity, and as the water-holding capacity of the soil is enlarged by the incorporation of the cover-crops and is retained by the tillage, the trees grow late in the fall and the fruit does not properly color before the picking season arrives. It is often possible to overcome the difficulty by severely pruning the top to let in more air and light. If this treatment does not prove efficient, the cover-crops may be withheld, when the fruit will usually mature earlier in the fall, unless the season is wet. As an additional treatment where necessary, the growth of the orchard may be still further checked by seeding it down until the desired condition is attained.

It is not possible to secure a uniform degree of maturity and size when all the apples on a tree are picked at one time, as fruit in different stages of growth is mixed together on the same tree. The apples differ in size and maturity in relation to their position, the upper outer branches producing the large, highly colored and early ripening fruit, while

the apples on the side branches and the shaded interior branches ripen later. Greater uniformity in these respects is approached by proper pruning and by other cultural methods, but the greatest uniformity can be obtained when, like the peach or the pear, the apple tree is picked over several times, taking the fruit in each picking that approaches the desired standard of size and maturity.

This method of picking is not usually adapted to the apple merchant who buys the crop of a large number of orchards, and who cannot always secure efficient or abundant labor, but to the specialist who is working for the finest trade and who has a storage house, near by or a convenient refrigerator car service to a distant storage house, the plan has much to commend it.—M. B. Waite.

### REPUTATION OF FRUIT AS A COMMERCIAL ASSET.

Speaking of investigations in the co-operative fruit marketing organizations of the northwest a New York orchardist speaking before his state convention said:

"Among the fruit growers' organizations in Oregon the two associations which have been the most successful have been the Hood River Fruit Growers' association and the Hood River Apple Growers' association. The former of these organizations confines itself for the most part to the marketing of strawberries. These two associations have been managed from the start with a view to establishing the highest possible reputation for their products. The members are not allowed to pack their own product, but, if they engage in the work of packing, they work on fruit grown by other members. I believe I am justified in saying that the associations have succeeded in acquiring for their product a reputation which assures them the highest prices paid for strawberries and apples in the United States. It is now possible for the Apples Growers' association to sell its fruit to merchants in eastern cities at high prices without inspection.

I have no doubt that it will be found necessary in the near future to have all fruit in any one package of uniform quality and size, as near as may be, and this can be best brought about through associations of growers, as in this way the temptation to place poor fruit in the interior of a package can be reduced to the lowest possible limit. An association, also, by reason of the greater volume of fruit handled can acquire a deserved high reputation for honest packing and good fruit much sooner than the individual growers could do with their limited output and multiplicity of brands.

In handling cured prunes the Willamette Valley Prune Growers' association did very valuable work in introducing Oregon prunes under favorable auspices in England and throughout the United States and making for them a market which did not exist and which the ordinary methods of handling through merchants developed so slowly that without the work of the association there would not yet have been a demand for more than a fraction of the crop produced, whereas, as a result of the work of the association, there is now a profitable market for all the cured prunes produced in this state."

Kerman alfalfa growers are now delivering from their fourth cutting.

### NUT GROWERS CONVENTION.

The eighth annual convention of the National Nut Growers Association will be held in Albany, Georgia, October, 12-13-14.

Last year seventeen states were represented at the annual gathering at Chattanooga; but this year's meeting promises to far exceed any previous one both in interest and attendance.

A most interesting program is being arranged for this meeting that will practically cover all phases of nut growing.

There are more pecan orchards within seventy-five miles of Albany than within any other equal area in the world.

In planting a commercial orchard of any sort of fruit it is unwise to plant too many sorts. There is more money usually from a large flock of trees of all one kind, if they are a good commercial kind, than from the same number of trees of several different kinds. Mixed lots of fruit can never be handled with as much satisfaction as a large crop of one or two kinds. But a family orchard should have as large a variety as possible and of the best eating fruit.

The origin of the cultivated apple will always remain indefinite It is known to date back to the beginning of the Christian era, when the Romans cultivated a few varieties of apples.

The beet harvest at Hamilton City began September 2nd.

# Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## MILK.

By Mrs. M. E. Sherman.

MANY people are puzzled over the difference between the various kinds of milk, sold under the names of bottled milk, certified milk and steamer milk. The names indicate different degrees of care in the production. Bottled milk today is a far cleaner and better product than the milk sold a few years ago out of large cans. I used to see the milk man measure the milk into open pitchers and let it stand on the door steps until the lazy housewife got up in the morning. The dust blew in and the prowling Toms, thirsty after an all night concert on the back fence, found it quite refreshing. I remember well seeing a cat have its head caught in a narrow pitcher and fall down the steps into the street with dolorous howls, until the pitcher kindly broke and released him. Bottled milk from the ordinary dairy is inspected more or less often according to the efficiency of the local health officer. It is a reasonably clean and wholesome product. Certified milk is produced under supervision of a special committee and is sealed with a certificate label guaranteeing that the regulations have been complied with. It is clean milk cooled and bottled. Steamer milk is produced by experts and kept from bacterial contamination by every known means. It is bottled directly from the cows and chilled afterward. It is called steamer milk from having been first prepared for the trade of the Atlantic liners and has often been perfectly sweet three weeks after drawn from the cow.

### Clean Milk.

Bottled milk as supplied is clean milk, more or less, according to the ideas of the dairyman who produces it, the general quality of the officers who inspect the milk, and the amount of favoritism shown to the dairyman. The State Pure Food law is strict and it has an impartial officer. Prof. M. E. Jaffa of the University of California is the prosecuting officer. The word certified as applied to milk and its products is copy-righted asd controlled by a New Jersey corporation. The majesty of the law has not been tested in regard to this copyright, but it is likely that a quibbling shyster could overthrow it. It is to be hoped that this will not happen, as the definite control represented by the word "certified" has been worked out until it is on a practical basis. Mr. Stephen Francisco permits the use of the word "certified" to any dairy where the restrictions are compiled with as laid down. First a commission must take charge, having a committee appointed to see that the regulations are followed. The dairyman is protected against extortion by the fact that when the required care has been given, the Commission cannot withhold the right to use the word "certified."

### Practical Working.

The first certified dairy in California was the Walnut Grove of Oakland and at that time the certificate was given by the Oakland Home Club. Now the certified dairies of this same district are under the Alameda Medical Society. The great value of this plan is that it can be carried out. The difficulty of milk inspection in the past has grown out of the ignorance of the inspectors and health boards, ignorance of the practical part of the work. It is easy to sit at a desk and formulate theories but to make a theory that can be worked into a plan requires executive ability of a high order. The doctors as professional men are poor executives, as they are accustomed to work by themselves. Working together is one of the things that they do not learn readily and a dairyman must secure the intelligent cooperation of every man about the barn if he is to have his orders carried out.

### Profits.

At the present prices the margin of profit is not large and economy must mark every step. The fact that cows must be milked regularly and on time makes a regular, dependable milker a good asset. He must not be offended or coerced beyond his endurance. Milkers do not always come from a dainty class of people that understand bacterial cleanliness. How little it is understood by the ordinary housekeeper! While we have no peasants in America there are many that have the ways of peasants and the bath is only a part of the dressing up process to go to town. The problem of keeping the girls on the farm would be in part solved if the house had abundance of hot water and a good bathroom. The failure of some dairies to lower their bacterial count has turned on the impossibility of retaining the milkers if the requirements are enforced. When milking is done by machines, the difficulty is at first lessened, but then trouble comes from the help not understanding that the machine must be kept immaculate. I sigh for the time when the milking machine is in full use and a success. This will not comes until Davis sends out its graduates in large numbers. With trained men in the dairy the head man's life would be easy, and yet it will cost money. The price of milk is traveling up and there seems to be little reason to think it will grow less, for with skilled labor naturally the wages will continue to increase.

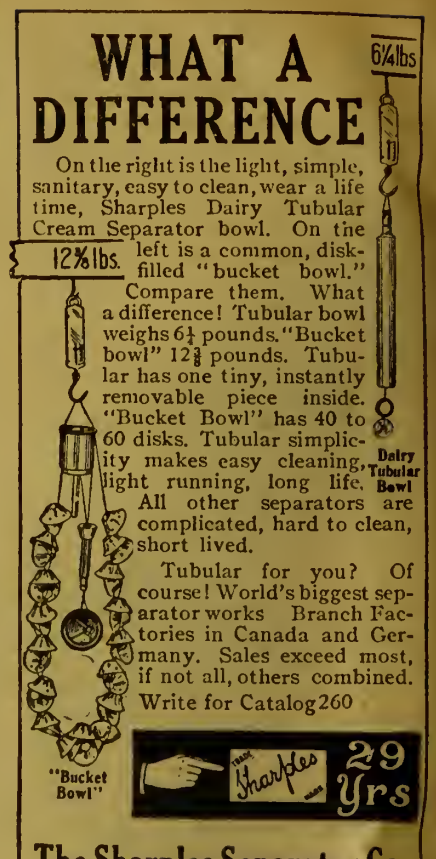
## REMEDY FOR LONG CHURNINGS.

The causes of long churnings of cream are usually churning a thin cream and at a low temperature. The temperature mentioned of 58 degrees and a cream testing 34 per cent is all right, and under ordinary conditions one and one-half hour's churning is not considered any too long. If you warm the cream to 65 degrees there is no doubt but that the churning will be much shorter, but there will be a large loss of butter in the but-

Cream Separators, all sizes, and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

Anthrax Cure, Milk Fever Outfits See O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

WHAT A DIFFERENCE



On the right is the light, simple, sanitary, easy to clean, wear a life time, Sharples Dairy Tubular Cream Separator bowl. On the left is a common, disk-filled "bucket bowl." Compare them. What a difference! Tubular bowl weighs 6¼ pounds. "Bucket bowl" 12⅝ pounds. Tubular has one tiny, instantly removable piece inside. "Bucket Bowl" has 40 to 60 disks. Tubular simplicity makes easy cleaning, light running, long life. All other separators are complicated, hard to clean, short lived.

Tubular for you? Of course! World's biggest separator works Branch Factories in Canada and Germany. Sales exceed most, if not all, others combined. Write for Catalog 260

termilk. You will, therefore, have to choose between reducing the time of churning or increasing the loss of butter in the huttermilk. By churning the cream at a temperature of 60 to 65 degrees, the butter will undoubtedly come within half an hour; the buttermilk, however, may test as high as 1 per cent fat. By churning at a temperaturo of 55 to 60 degrees the butter will come in about an hour and the buttermilk will have a fairly low test.

If the mixed cream tests over 30 per cent fat and it is extremely sour before churning, the butter ought to come within a reasonable time, if the cream is churned at a temperature of 58 degrees.

The length of time that hutter should stand before salting will depend on the temperature of the butter. If it is soft, the salt will mix with the butter easily and there is no necessity of allowing it to stand more than 15 minutes before packing. If the hutter granules are hard, the salt should be mixed with it, then worked in three periods of time, allowing the hutter to stand for the salt to dissolve between each working period. The salt should he dampened before it is added to the butter in any case.—Hoard's Dairyman.

## NORTH DAKOTA RELEASED FROM QUARANTINE.

The Secretary of Agriculture has issued an order effective September 1, releasing from quarantine on account of scahies or mange in cattle that portion of North Dakoto lying south and west of the Mississippi River. Up to Octoher 1, 1908, the entire State was in quarantine for this disease, hut on that date the part north and east of the Missouri River was released, the disease having heen eradicated from that section. The work of eradication has heen continued by cooperation between the Federal and State authorities with such good effect that the entire State is now pronounced free from the disease and the quarantine is removed from the last remaining portion.

The area still under Federal quarantine on account of this disease comprises the northeastern part of Montana, the southeastern part of Wyoming, the eastern portions of Colorado and New Mexico, the western portions of South Dakota, Nebraska, Kansas, and Oklahoma, the Panhandle of Texas, and a small area in the extreme southern part of Texas. The Federal and State authorities are working these regions, and it is the policy of the Department of Agriculture to remove its quarantine as rapidly as the disease is eradicated from any considerahle area.

Very recently the Department of Animal Husbandry of the Ohio State University, through the McLaughlin Bros. of Columbus, has imported four Percheron yearling fillies from France. These were four of the hest yearlings Mr. McLaughlin could find in the Percheron district. These four fillies add greatly to the horse equipment for educational work at the Ohio State University The University now owns pure bred breeding Percherons, Clydesdales and Hackneys, and a Morgan stallion of splendid breeding and character.

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

## HORSE NOTES.

A clipped horse will catch cold less easily than one not clipped.

Do not over feed of hay, especially at night. It is not good for a horse to eat all the time.

Water before feeding. Then water again before going to work.

For itch or mange, rubbing of tail or mane, wash thoroughly with warm soft water and soap, then rub in with brush a proper strength of coal tar dip used on sheep and hogs. Scrub every three or four days until cured.

Disinfect stalls and harness also or you never will get rid of the pest.

Give only half rations on Sundays when team is idle. A little grass then is good tonic.

Both the brood mare and the stallion can be carefully worked to their hetterment. They should not he overworked, of course—just given regular exercise.

If manure smells very strong when voided something is wrong with the feeding.

When a long drive is expected do not feed quite as much as usual. They travel better.

The corn-fed horse lacks spirit, tires easily and sweats profusely.

When shedding teeth the horse may not eat as well as usual. Do not dope, cut gums or torture hy burning. Give nature a chance to work off those twenty-four milk teeth. This is not finished until six years old.

The high-headed horse can better be bridled hy having a snap on the bit. Put hridle on then snap the bit in place.

Use the same common sense in horse feeding that you do in taking good care of yourself and you will he little hindered in work by horse colic, heaves, etc.

The horse has but one stomach and that is small. So he can't load up for all day like the steer and digest it at leisure.

The heavy work season is on and the team needs different feeding than was given during the idle season. They are shedding and growing a new coat, the mares are growing colts, and so it takes more feed.

## FUNDAMENTALS.

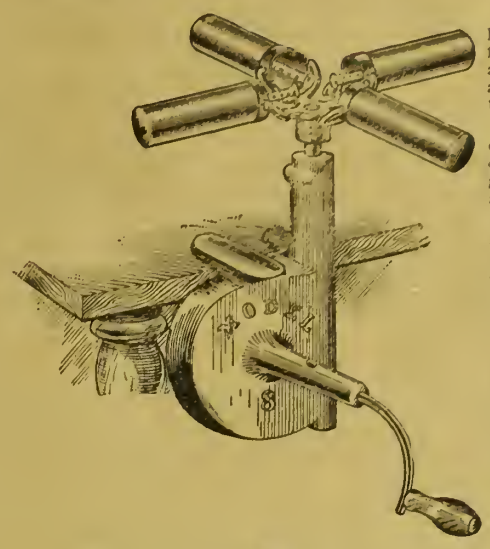
These seven fundamental principles of successful dairying were formulated at the Illinois Farmers' Institute:

1. Weed out the poor cows by means of the scale and Bahcock test.
2. Feed the good cows a balanced ration.
3. Grow alfalfa and provide an abundance of silage.
4. Head the herd with the best sire obtainable.
5. Raise the heifer calves from the best cows.
6. Continue to weed, feed and breed.
7. Feed the mind of the man behind the cow.

Five imported Swiss milch goats have recently arrived at the Wisconsin Experiment station. These goats are of the breed known as Schwarzen burg-Guggesberger, a breed noted for its milk-giving qualities. The ohject in maklng this importation is to experiment with the milch goat in this country, and compare their economy of milk production with that of cattle.

The Portland Fair and Live Stock Association holds its next fair September 20 to 24.

# Improved Babcock Tester



Babcock Milk Tester, an extremely simple, light, compact and carefully designed apparatus, especially adapted for use in the dairy and also on account of its light weight to the Traveling Dairy Inspector.

The working parts are entirely enclosed in a handsome cast-iron case, and consist of but two cut gears, namely, bronze spiral gear and steel spindle with worm thread.

The Tester is fitted with swinging pockets and malleable iron head; it turns very easily without any vibration or jar and can he readily attached for operation to any table or bench. The bottles are perfectly horizontal when rotating.

All our stock comes from the celebrated herd, formerly owned by the Pierce Land and Stock Co., the premium herd of Holstein-Friesians in Cal. Write your wants.

**OAKWOODS STOCK FARM CO.** Lathrop, Cal.

One of the greatest advantages of alfalfa as a hog pasture is the fact that it affords a fresh growth throughout the grazing season. The pasture should he mowed at least three times each season, thus taking off all the matured stems and giving opportunity for the sending up of a new, tender growth, just the quality the hog delights to feed on. It is this new, fresh growth that makes alfalfa pasture so generally preferred hy the hog and so highly satisfactory as a flesh former. The hog wants fresh pasture. He does not graze like the horse, cow or sheep, but is hest suited when he can bite off a clover bloom or a sprig of alfalfa, and does not from choice like to feed on a thick, heavy-coated blue-grass sod. He objects to moldy, wet or soured grasses, such as the blue grass and white clover pastures so frequently afford when not closely grazed.—From Coburn's "Swine in America." "Swine in America."

# Small Fruits and Vegetables

### FERTILIZING THE GARDEN.

THE best garden soil does not exist; it must be made. We expect our garden plants to do wonders, and to realize this expectation the garden soil must be made "wonderfully" rich. In the garden a great variety of plants with a variety of soil needs are to be grown each year. For this reason the soil must be given a variety of fertilization.

Some people think, or say, at least, that soil can be made too rich. Such seldom, if ever, happens, providing a variety of fertilizers is used, and these well mixed with the original soil. Fear feeding the soil too little rather than too much, and feed it some every year.

Stable manure in which liberal bedding has been used is the foundation for all garden enrichment. This contains valuable nitrates and other fertilizing elements besides a large proportion of vegetable refuse for making humus, the very body and soul of high soil production. Most authorities advocate the use of "well rotted manure only," but the writer has found by years of experience that the manner in which manure is used is of more importance than its age.

Old or well-rotted manure is, beyond question, the best for general use, but this kind is scarce and usually very difficult to secure. Plants can immediately take hold of and utilize well-decomposed stable manure. It has passed through the heating stage, hence there is no danger of injury to the growing plants from that source. For very tender plants no other kind should be used. But manure which has been allowed to decompose has lost a part of its fertility, and fertilizing elements are all worth money and should not be allowed to go to waste.

For standard garden crops any fresh stable manure can safely be used if applied and handled in the right way. If it is to be applied to the surface of the soil it should be put on in the fall, spread very evenly over the surface to avoid lumps, and plowed under before freezing weather. Lying in the soil for several months when no crops are growing, it will partly decompose and be ready to feed the plants the following growing season. In the spring, or at any season just before a crop is planted, fresh manure must be applied to the surface of plowed or spaded soil. It should be spread thin and even, without lumps, and worked into the surface with rake smoothing harrow or disk. Here it will be in a position not only to feed the plants through dissolving rains, but also to act as a surface mulch to hold moisture during dry weather. Each cultivation will break it into finer pieces and mix it with the soil, and each rain will dissolve out rich foods which will immediately be caught and used by the roots of the growing crop before they have a chance to escape.—Journal of Agriculture.

---

Now, I want to say a word in regard to the wheel hoe. It is indeed indispensable and the greatest labor saving device in the world. If you have never tried one be sure and invest in one this season. I have one with all the different attachments. When I use it, instead of being drudgery, gardening becomes a pleasure, a joy, a fine art, if you please.

### THE USE OF NITRATE OF SODA.

I am getting dozens of inquiries about using nitrate of soda on garden crops. Now, I believe it is very valuable in some soils, but with me it gave no results whatever. Probably this was because my ground is already rich in nitrogen from the use of clover, cow peas and barnyard manure. For soils that are deficient in nitrogen, nitrate of soda would be very valuable on account of its quick action. Use it as a top dressing at the rate of 100 pounds to 200 pounds per acre, and make three or four such applications during the season. The first rain will wash it into the soil and it will be immediately available. But for the general gardener the nitrogen can be secured much more cheaply and in more permanent form by the plowing under of cow peas, clover and well rotted barnyard manure.—St. Jo. Fruit Grower.

### CABBAGE WORMS.

The butterfly which is the adult of the cabbage worm is about two inches across. They are in the chrysalis stage in summer time from one to two weeks, but those late in the season remain until spring before coming out as butterflies.

So this pest can complete its life cycle in from three to five weeks, thus the necessity of keeping watch for new broods of the worm.

Remedy. One pound of Paris green in 150 gallons of water sprayed on plants when first set and until heads are about half formed will poison the worms. Pyrethrum powder can be used by those who fear the former remedy. Hot water (130 degrees) is recommended but we have failed to get results with it.

By leaving a few heads as traps on which the females lay late in the season the last crop of worms can be poisoned on these.

### ABOUT ATHLETICS.

Now, I may be cranky and queer, but I believe that an hour's work in the garden is better for the boy than an hour playing ball, and a great deal more beneficial to the community in general.

---

The life cycle of most vegetables is a brief one, consequently they must find a sufficient supply of all the elements of growth in such form as to be readily taken up and quickly assimilated. Vegetables can't plod along through a long season like corn or wheat. Their days are numbered by weeks, not by months. And so I have found that manure is the thing for them—more manure and still more manure. There is another home-made article that I use to great advantage in my garden—green wood ashes from the cook stove. I save every ounce of it. Cabbages simply laugh and grow fat on it, and many other vegetables grow much larger and finer by its use.

---

Strawberries and weeds do not go together if a good crop of the former is desired.

# The Ornamental Garden

### MONSTERA DELICIOSA.

ONE of the most interesting of the decorative climbing plants of the Honolulu garden is the species of Philodendron, Monstera deliciosa. In favorable sites upon old walls or upon trees it grows freely, and its generous sized leaves ornamented with a margin of oval perforations, together with the somewhat snake like form of its mottled aerial roots give the plant an unusual and attractive appearance.

Although unexpected, this somewhat weird creeper yields one of the most exquisite and delicate of tropical fruits. The flowers are small and unpretentious, but are surrounded with a large white spathe as are other members of Araceae. The fruit, which is vivid green in color, becoming duller as it ripens, consists of a quantity of hexagonal sections arranged spirally upon the central stem. Those who are familiar with the pineapple will notice the similarity of its fruit to the Deliciosa, which latter may be likened in appearance and construction to a greatly prolonged but much narrowed green pineapple without the latter's decorative crown or generous coloring. When fully grown the Deliciosa measures about fifteen inches long and three in diameter.

The taste of this exquisite fruit is to be described as partaking of a mixture of tropical flavors in which that of the pineapple predominates. When ripe it diffuses a very fragrant odor. One peculiarity of the Deliciosa is the length of time which the fruit when fully grown requires to ripen—a period of many months elapsing before it is ready for the table. Another unusual characteristic is that it commences to ripen from the end and is only suitable for consumption in sections—two or three inches being available for eating daily. In this way a good sized fruit lasts some days, the exterior hexagonal flakes becoming detached and revealing the ripened sections below.

To all who are fond of fragrant fruits the Deliciosa is recommended. Its peculiar growth and unusual characteristics make it an object of great interest, while its delicious fruit possesses a luscious flavor which few other varieties can claim.—Hawaiian Forester.

### CONSIDER THE TOAD.

A man seldom has any enmity for the toad though some hold to the foolish notion that he is a wart producer, but it is the boy that needs a word of instruction.

Teach the children never to harm a toad. It is a very harmless creature and does nothing but good. As an insect catcher the toad is a star player. You will find him at work in the garden when the world is asleep. He gets after the injurious insects. The more toads you can have in the garden the better.

---

Liquid manure should be applied only when the ground is moist enough to absorb it.

---

Never allow roses to remain on the bush until the petals begin to fall.

### LATE PLANTING OF EVERGREENS

The best time to plant evergreens is early in the spring just when the new seson's growth is starting. If the planting is delayed until June, the trees are not apt to do well unless frequently watered and mulched during the summer months.

Some planting is done in August, but we do not believe an inexperienced person can make his trees grow when planted so late.

When evergreens are planted late they should be thoroughly watered and a dust mulch maintained around the roots until winter sets in.

It is difficult to tell by the looks of the trees whether they are alive during the late summer months or not, as very often they retain their verdure some time after they are dead.

In the spring, however, trees that die turn brown within two or three weeks. The better time to plant evergreens is, in our opinion, in the spring.

### SILK WORMS.

A communication from Mrs. Carrie Williams of San Diego, a pioneer in the silk industry, who still maintains her interest in it, says that she feels certain that the silk industry will soon be placed upon a more substantial and profitable basis than it ever has been. She adds: "For seventeen years I have given time, talent and money in endeavoring to interest the people of the Golden State in the silk business from a practical standpoint. I now begin to see the light dawning, and hope before long to see in this city a silk museum, menagerie and silk school, that will form the nucleus of the production of silk throughout the state and nation. At no time in my memory has there been such interest. This is especially true with teachers, who, with other branches of nature study, are giving much attention to silk production."

---

It is permissible to plant two or three elegant single specimens of shrubs or trees upon the lawn, provided they are so placed as to appear to be a part of the larger masses adjoining. For this purpose we use only trees of the most beautiful form.

Try a few of the summer blooming bulbs and tubers, tuberous rooted begonias, caladiums, dahlias, cannas, tuberoses, etc. They are satisfactory summer bloomers.

---

Did you ever think what a beautiful and long-flowering garden one might have with just the P's? Sweet peas, poppies, pansies, primroses, peonies, poinsettias, primulas, petunias, phlox, portulacca. With no more flowering plants than these one may have flowers every day, all of them being easy to grow and continuous producers of brilliant flowers.

---

All flowers keep in bloom much longer, and the flowers are larger, if not allowed to form seeds. Pinch off every flower as soon as it begins to fade This is especially true of sweet peas and pansies.

---

It is fatal to some plants to fertilize them with rich manures when the ground is very dry.

**Malthoid Roofing**

F. P. Wilson, owner of the Wilson Building, Dallas, Texas, says: "My roofing laid in 1904 has given excellent satisfaction in every particular. I advise anyone who intends putting on a good roof to investigate the merits of Malthoid before making purchase."

## Contents

ON THE ROAD TO SAN GABRIEL MISSION, Cover.

LEMON GROWERS DAY OF PROFIT AND FUN, 267.

CITRUS AND SUB-TROPICAL FRUITS.—Fumigation Dosage; Composts and Composting; Hawaiian Notes, 268, 269.

DECIDUOUS FRUIT CULTURE.—Unfermented Grape Juice; How to Obtain More Uniform and Better Colored Apples; Reputation of Fruit as a Commercial Asset; Nut Growers Convention, 270, 271.

LIVE STOCK AND DAIRY.—Milk; Remedy for Long Churnings; North Dakota Released from Guarantine; Horse Notes; Fundamentals, 272, 273.

SMALL FRUITS AND VEGETABLES.—Fertilizing the Garden; Use of Nitrate of Soda; Cabbage Worms, 274.

ORNAMENTAL GARDEN.—Monstera Deliciosa; Consider the Toad; Late Planting of Evergreens; Silk Worms, 275.

EDITORIA.—Stand by the Reclamation Service; Play Day; Co-operate;. Farmers. Week; .Study Your Own Conditions; Crop Conditions; Farmers Institutes, 276.

AGRICULTURAL NOTES OF THE PACIFIC COAST.— Northern, Central, Southern, The Coast, 277.

PROFIT IN THE POULTRY YARD.—Closer to the Natural; Summer Care of the Flock, 278, 279.

IRRIGATION AND FORESTRY.—National Aid to Irrigation, 280.

QUERIES AND REPLIES.—Bloody Milk; Silo Stack; Fence Post Dip; Late Cultivation; Black Eyed Beans; Kaffir Corn; Output of Beans; Salt Bush; Stunted Pig; Milking Machine; Fleas; Thoroughbred; Soft Scale; Eucalyptus for Fuel, 282, 283.

HOUSEHOLD.—The Prayer Perfect; The Red Desire; Help for Emergencies; New Way to Can Tomatoes; To Be Beautiful; Just Be Natural, 284, 285.

PRODUCE MARKET.—Los Angeles Markets; San Francisco; Citrus Markets, 286, 287.

## Stand by the Reclamation Service.

THE contest between Secretary Ballinger and Mr. Pinchot of the Reclamation Service seems to have quieted down somewhat for the present, though it must be confessed that in the short time is was before the people, it aroused the entire West as have few other events, and so far as can be judged from the newspaper comments, the sentiment of the country is almost unanimously with Mr. Pinchot. Occasionally a paper sings rather low in support of Secretary Ballinger, but it is usually of that class of papers termed supporters of the "interests." The remark made by Secretary Ballinger at the Spokane Congress indicating that he regarded the reclamation service as of no particular advantage to the larger class of people, that it should be kept out of the field and allow private capital to develop irrigation enterprises, has put him in a position where he will be compelled to make explanations. Plainly he is going contrary to the Roosevelt policies, and if there ever have been policies fully accepted by the people of this country they were those established by Theodore Roosevelt.

According to the disposition manifested by Mr. Taft along other lines, he has, so far as can be judged, kept his hands entirely off of this matter. What he will do later remains to be seen. Meanwhile, let the friends of reclamation be as calm as possible, at the same time insisting on the continuance and fullest support of the reclamation work.

It has been suggested that the whole matter is merely a jockeying back and forth of different wings of political parties for the sake of securing political advantage. If this is the case, it is time for the "common people" to rise up and insist that the political maneuverings shall cease.

* * * *

WE NOTE that the news despatches chronicle the return of Secretary Ballinger to Washington earlier than he had expected. Some papers have been unkind enough to say that it was by emphatic request of President Taft. The Secretary himself, however, positively asserted that it was merely to attend to the necessary duies of his office. Certainly his declarations at Spokane were such as to cause much uneasiness on the part of those who hope to see a few of our great resources remain in the control of the people.

## Play Day.

AS WE remember our boyhood days on the farm we are reminded that at least once a year, usually on the Fourth of July, the farmers had a rousing big picnic. But that particular day was very likely to be spoiled by a thunder shower and really enjoyable days were few and far between. Present day farmers have improved somewhat along this line and meet for a "play spell" oftener than they used to. They realize the actual advantage and commercial worth of a good "play spell." It is the sauce which gives zest to the other work-a-day tasks. We believe there should be more of them. Incidentally, as has been the case with farmers clubs, orange exchanges, lemon clubs, and other organizations, a little serious discussion may be mingled with the fun.

Meantime, don't forget that the young people on the farm should be offered their opportunity for play days and the conveniences for a good time on or near the farm or ranch.

## Co-Operate.

AFTER ALL the reducing of acreage and the encouraging of the belief that this year's cantaloupes would pay better than usual, the growers of the Imperial Valley, having struck their balances, in some cases, find that they are on the wrong side of the ledger. In most cases, however, they are on the right side, but it takes so few figures to express them that a most discouraged feeling prevails. We believe this will continue to be the situation with the cantaloupe men, at least intermittently, so long as present marketing methods prevail. The great lesson of co-operation must be learned, and no better study can be taken up by rural dwellers than that of co-operative marketing. In doing so, let us not be confused by thinking that we are forming a trust to arbitrarily boost prices, but simply applying the best business methods to the disposal of the product in hand.

## Farmers' Week.

THE STATE farmers institute which has for the past two years been held in October at the state farm at Davis gives way this year, or rather is changed somewhat in form, and a week to be known as farmers week, Oct. 25-30, will take its place. Prof. Clarke writes: "The general idea of the week is to have various meetings, for instance one day will be devoted to a round-up of farmers institute workers." Other days we suppose will be given to the discussion of various farm methods.

The demonstration train service also will be taken up again this fall, starting possibly about the 15th of November.

## Crop Conditions.

ACCORDING to estimates made by the Bureau of Statistics, United States Department of Agriculture, crop conditions in the United States, in the aggregate, declined during August 1909 about 6.9 per cent which compares with a decline in August last year of 4 per cent, and an average decline in August of the past ten years of about 3.2 per cent. On September 1, general crop conditions (including crops harvested before August 1, with their condition at time of harvest) were about 2.6 per cent lower than on September 1, 1908, and 2.9 per cent lower than the average condition on September 1 of the past ten years. As a consequence of the unfavorable August, general prospects were changed from above average on August 1 to below average on September 1. Compared with the ten-year average condition, which is represented by 100, the condition on September 1 of important crops was: Spring Wheat 115; Oats and Grapes 105; Flaxseed 103; Rye and Potatoes 101; Hops 100; Hay 99; Tobacco 97; Barley 96; Rice, Sweet Potatoes and Sugar Cane 95; Buckwheat 94; Corn 93; Sorghum 90; Cotton 87; Apples and Peaches 80.

## Valuable Advertising.

THE California Fruit Growers Exchange has issued a booklet of recipes and paragraphs showing advantages of Sunkist lemons. It maintains that one may profitably use California lemons from getting up time in the morning till going to bed time. In addition there are hints for the sick room and for many miscellaneous kitchen and toilet uses. Incidentally, there is in the back a department given to California Sunkist oranges.

It is good advertising, and we imagine will accomplish fully as good results as were accomplished by the Exchange in its newspaper advertising over the Middle West last year.

## Farmers' Institutes.

A LETTER from Prof. W. T. Clarke gives the following institute dates: Grass Valley Sept. 15, 16; Gold Hill, Placer County, Sept. 17, 18; Dorris, Siskiyou County, Sept. 25; Macdoel, Siskiyou County, Sept. 27; Edgewood, Siskiyou County, Sept. 29. Other dates between Sept. 29 and Oct. 15 will be filled later. Oct. 15, 16 is given to an institute at Napa.

The average condition of Corn on September 1 was 74.6, as compared with 84.4 last month, 79.4 on September 1, 1908, 80.2 on September 1, 1907, and 80.6, the ten-year average on September 1.

## The Lemon Men's Club

(Continued from Page 267.)

The packing house of the exchange was a gathering place for a large number of lemon men after the meeting at Mr Hubbard's home The newly constructed room where the lemons are to be "sweated" and colored was inspected and was found most complete for the purpose Two rooms are constructed, each of which will hold about a carload of lemons. Arrangements will be made in the basement for raising them to the required temperature and holding there until in the proper condition for shipment. These rooms are to be used only in case it is necessary to push the lemons onto the market as soon as picked. The packing house is under the general management of Mr. R. H. Hille.

This is the first meeing of this kind ever held by the Club. It has usually been so absorbed with discussions of serious questions that no time has been taken for the pleasure of such a day as this. This day's enjoyment was made possible by the hard work and enterprise of R. H. Wilkinson, T. J. Walker, C. C. Reynolds and C. D. Hubbard. These men had made provision for the various trips taken and for the big feed under the fig trees at the home of the Mission View Ranch. Mr. and Mrs. Hubbard had worked hard to make provision for such a large number of people, and it may be taken for granted that the hungry visitors watched with much interest the barbecue methods of preparing nearly sixty chickens.

Those who were not members of the club left with the conviction that the members were all truly "first grades," "regulars," and "good keepers" and all were anxious to have the same kind of a lemon handed them again.

# Agricultural News Notes of the Pacific Coast

## Northern California

Lodi has a pre-cooling plant nearly ready for its first test.

The first car of Florin's Tokay grapes brought the Association $1,833.00.

About 150 laborers are employed in the fruit drying yards at Yuba City, Sutter county.

One lumber company has purchased 18,000 acres of timber land in Siskiyou county.

Yolo county is aleady shipping large quantities of sugar beets to the Alameda sugar factory.

Four hundred and six cars of fruit were shipped through Sacramento for Eastern points last week.

More money is being invested in reclamation schemes in the Sacramento Valley than ever before.

The bean crop in the section around Biggs, Butte county, has been greatly reduced by the red mite.

The Forest Syndicate Tract Co. at Willows, Glenn Co., will plant a large tract to eucalyptus trees the coming season.

The citrus fair association of Butte county has decided not to hold a fair this season but will hold a larger one than ever before in 1910.

Machines for picking hops are proving satisfactory with more extended use. Several are in operation near Wheatland and Sacramento.

The feeling of indignation against the Wine Makers Association for its price and terms for the coming wine grape crop is general all over Northern California.

A compromise has been effected between the various wool growers associations and the county of Tehama and the State of Nevada regarding sheep licenses.

The hop crop showed a shortage over expectations before picking began. Some pickers have already cleaned the yards, and it is claimed that the state will produce less than estimated.

Yolo county's exbibit of agricultural products in the State Board of Trade rooms in the Ferry Building is declared to be an injury to the county because of not being kept supplied with fresh fruits.

A meeting of the Yolo County Grape Growers Association was held recently at which it was determined not to market their grapes at five dollars a ton, and it is hoped a scheme may be devised which will bring the growers a greater return.

The board of supervisors of Sacramento county have authorized the county horticultural commission to employ an inspector to secure if possible the eradication of Johnson grass which is becoming a great pest in that county.

The American Fruit Co. at Antioch has made a series of experiments covering the past four years in the shipping of fruits without the use of ice but in a car filled with nitrogen gas. It is reported from the experiments that this method may succeed refrigeration.

## Central California

Hanford shows a 51 pound watermelon.

The shipping of Malagas begins at Hanford this week.

A few raisin grape men began the season's picking last week.

"Hold your raisins," seems to be the slogan amongst the raisin men.

The fruit crop of the country surrounding Atwater is much less than last year.

The coming Tulare county fair promises a most complete and attractive exhibit.

The Fresno county portion of the National forest reserve is more than paying its own expenses.

An onion seed grower at Alpaugh, Tulare county, has netted $400 per acre from this season's crop.

The Visalia sugar factory is confronted by a suit for $26,000 begun by the National Bank of Visalia.

The outlook for beet sugar in California seems to be better than in any other state in the Union this year.

During the past year the Laton Co-operative Creamery has paid to its members $169,139 for 586,758 pounds of butter fat.

Kings City shipped its first car of beets to the Spreckels factory last week. That section will produce about 500 cars.

A creamery is about to be started at Delano, Kern county. It has assurance of sufficient cream to make a successful run.

Santa Clara has a pumpkin vine which has climbed a pear tree and has seventeen good sized pumpkins as fruit of the "tree."

The Santa Clara Valley Poultry Association is making extensive preparations for the finest show this fall yet held in the state.

The farmers union has released all wine growers from their contract as the union has been unable to secure any price for this season's output.

Prices of figs in the Fresno section have shaded somewhat and are now ranging from 1¾ to 2 cents, the former prices having been around the 2½ cent mark.

One of the largest wine grape growers in Fresno county asserts that where wine grapes are sold for less than ten dollars per ton, there will be no profit to the producer.

Some of the large raisin growers of Fresno county recently held a meeting and decided to form a corporation which it is hoped will ultimately be a factor in the raisin situation.

A cattle rancher near Tulare recently discovered a large number of ticks on his cattle, but an examination by the county veterinarian showed that they were not of the Texas fever variety.

It is estimated that this state this year will produce about 1,000,000 bags of lima beans, 370,000 of pinks, 533,000 large whites, 145,000 small whites, 86,000 bayos, 103,000 blackeyes, with about 100,000 bags of others, making a total of about 198,000,900 pounds, or in carloads nearly 5000.

## Southern California

Baled alfalfa is now selling at $8.25 in Imperial county.

San Diego is planning for a world's fair to be held in 1915.

The Orange county bee inspector reports no foul brood in that county.

A most interesting farmers institute was held at Fullerton last week.

Imperial county farmers union recently held an important meeting at El Centro.

Pickers are now busy in the apple orchards of the Yucaipe Valley, San Bernardino county.

Fullerton says that her yield of sweet potatoes will not be more than half that of last year.

At least twenty-five per cent. damage was the result of the recent hot wave on the Ventura bean fields.

The price of 80 cents per hundred pounds for picking cotton has been fixed upon in the Imperial Valley.

Redlands honey producers report a good outlook for all their output this season. Honey is very fine quality.

Ventura county bean growers have sent several thousand stick pins made of lima beans to Seattle for distribution.

Los Angeles markets show higher prices for eggs during the month of August than for the same month any other year.

The dash of rain which came to the Highland citrus section made much extra work to keep the orchard lands from baking.

The Orange county board of supervisors are considering an ordinance requiring licenses from all fumigators of orange trees.

Careful orange growers estimate the output of the coming crop at Redlands and Highland at about 65 per cent of last year's.

Warrants have been issued for the arrest of a number of cattlemen in San Diego county for bringing in cows without proper certificates of inspection.

Garden Grove, Orange county, is becoming an important shipping point for small fruits and vegetables. It is recently shipping at the rate of two cars daily of chili peppers, tomatoes and other produce.

The cantaloupe growers of the Imperial Valley are again seriously considering the co-operative marketing of next year's crop. The sales through commission men in the past year have been most unsatisfactory.

It is now reported that the price of orange box shook has been reduced to eleven cents per box for the coming year. This is six cents per box less than the price paid by the growers in 1907, and will make over one million dollars difference to Southern California orange growers.

The annual report of the Whittier Citrus Association shows that there has been paid in salaries to employees $34,000 during the last year. The entire labor and other expense of the association was $84,000. The year's shipments aggregated 252 cars of lemons and 264 cars of oranges.

## The Coast

Farmers Society of Equity recently held a meeting at Helena, Montana.

Eastern buyers have purchased large numbers of sheep at Weiser, Idaho, at $3.75 per head.

The Highland Canal near Phoenix, is promised to be carrying water to a large tract of land this fall.

A rich deposit of gold has been found underneath the orchard of a Lewiston, Idaho, fruit grower.

A large plantation of hazel nuts near Vancouver, Washington, shows great profit for this year's crop.

Fruit growers in Southern Idaho will make a large exhibit at the national apple show to be held in Spokane.

The Calapooia Poultry Association will hold its next annual show at Cottage Grove, Oregon, the second week in January.

An irrigation system to cost about a quarter million dollars is planned for Western Oregon. It will irrigate about 12,000 acres.

The Oregon wool clip will be worth more than four million dollars to that state this year. The yield is estimated to be about twenty million pounds.

An excursion party consisting of some of the most noted orchardists of the United States, recently visited the Hood River apple growing section.

A Hillsboro, Oregon, farmer aged 79 years has just cradled and bound his two acres of grain in a day and a half, not only binding but shocking the grain.

A smooth grafter worked the farmers of Eastern Oregon for $2.50 each to become a member of his "organization" which guaranteed its members dollar wheat.

The horticultural commission of Idaho is starting a vigorous campaign for a better fruit and the wiping out of many of the insect pests now in the orchards.

The largest load of wool ever marketed in Eastern Oregon was recently hauled in by eight horses. The load weighed 30,000 pounds and brought the owner $3600.

Over 30,000 California oranges were given away at the A-Y-P Exposition on Sept. 9. The same day over 3,000 cartons of raisins and several tons of fresh grapes were distributed.

A "smut" meeting was recently held at Garfield, Washington, at which fruit growers from all parts of the state gathered to discuss methods of treatment of the smut which is seriously infesting the wheat fields.

Water transportation has proven of great value to farmers near Pendleton, Oregon. Grain has been hauled several miles to the river where it commands three cents per bushel more than when delivered at railroad.

The Falls City Elevator Co. in Eastern Washington, a private corporation, will take over a number of the elevators of the farmers union which were not as successful as anticipated. At least twelve warehouses and elevators will be absorbed.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

## FOR MOULTING HENS

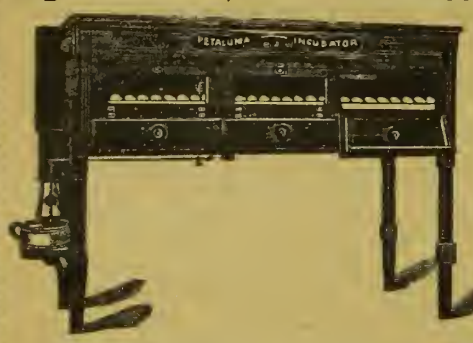
***Feed***

# MIDLAND

## Poultry Food No. 4

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.



***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

## Petaluma Incubator Company

**Petaluma, California**

Our General Agents for Incubators and Brooders and Midland Poultry Food:
**Petaluma Incubator Co., Petaluma, Cal.**
**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**
**Berrar & Robertson, San Jose, Cal.**

# STANDARD EGG FOOD

The kind that makes hens lay when other foods fail.

**90 Lb. Sack $2.35**

**Acme Roup Cure is Guaranteed. 50c Postpaid.**

**HENRY ALBERS CO., 845 S. Spring St. Los Angeles**

## MRS. C. D. HUBBARD'S WHITE WYANDOTTES

Eggs for hatching September 1st '09. Write for circular.

BOX 60, ROUTE NO. 1 SAN FERNANDO CAL

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

## CLOSER TO WHAT IS NATURAL.

**By Henry Langenschwadt, San Jose.**

HOW often we hear of the hen that steals her nest, and a chick for every egg is reported. This past season we have heard of many that have set hens. From twelve to sixteen eggs were given each. How many chicks were hatched? From one—no, from none—to eight or nine. In a few instances all or almost all eggs hatched. Why this difference in results between the hen that finds her own and the one we find a nest for?

Nature, in the first case, has had its course from beginning to end. There was no interference of any kind. The hen found a place for the nest. She evidently ought to know about what will make a satisfactory nest and, as a general rule, is a good judge. Please note, she did not place all the eggs in the nest at one time. One after the other, a day or two intervening between, she laid them. It took two or maybe three weeks until the number was completed. During the period of time in which these eggs were laid, they were in temperatures varying as much as forty or fifty degrees in the course of the day. This was not just one day, but day after day. Maybe they were wet by morning dew or rain in some instances. If so, they dried again during the warm part of the day, or the nest may have been damp or maybe it was sheltered in the barn or elsewhere.

### Nature's Way.

One egg after the other was simply laid in the nest by the hen. Was she careful whether they were placed on pointed or butt end or in any other particular position? She probably did move the eggs somewhat each time she visited the nest. By the time she had laid all the eggs the nest was to contain, her body was in condition for their incubation. For three weeks or so, she was contented, happy and undisturbed. That she performed this work well is evidenced by the number and vitality of her chicks. Her instinct told her what to do. In every way from the beginning nature's laws had full sway. We have a knowledge of part of these laws but there are more which we have not yet fathomed.

### The Other Way.

What shall we say about the many that set hens and obtain poor results? While it is called the natural method of incubation, has there not been much which was artificial in these cases? It was not the hen, but man that selected the place and made the nest. To his ideas it was right and good. We are not so sure whether biddy approved of it. Perhaps he should know better than she which was the best nest. The eggs were placed in it by him. These eggs may have been laid by one, two or maybe as many as a dozen different hens. Yes, they all should have been fertile, for apparently the hens were mated (?) because there were one or more males with them. Every day these eggs had been gathered carefully.

They were put where the temperature was just right. The books tell us just how many degrees. They also describe how they are to be placed in a certain position. Precisely every twenty-four hours this position must be changed. Whether there is any possibility for the hen to hatch a chick from each of these eggs is hard to say but it is rather expected that she will do so. A broody hen, that has finished laying her clutch of eggs which she would have liked to hatch, is secured and placed in the nest provided. She is taken from the nest she chose. The chances are that few or none of the eggs she laid are placed in the nest. She submits to all that is done to her. We question whether she is always as contented and happy as that other hen who had her own way. We shall not attempt to describe anything of what she has to submit to during the three weeks she sits on the eggs. The reader can, to some extent at least, imagine. Under the circumstances could we really expect better results than were had in many instances? We do know that, more or less, some of the laws made by man were followed out in many of these cases.

### The Wooden Hen.

We do not wish to dwell on the wooden hens that were set, nor to say anything of other branches of poultry work, but incidentally mention them now that you may know we have them in mind in making the concluding remarks.

### Too Artificial.

Why is there so much failure and often such poor results with poultry? Can we not attribute it to the fact that too much that is artificial and contrary to nature's laws is being followed in the work? We do not desire that the reader should infer from what we have said that to get a good hatch and vigorous chicks it is necessary to have the hen steal her nest. But let us study more closely the nature of the hen. The one that steals her nest has, no doubt, the mother instinct well developed or she would not be so anxious to have a brood of chicks. Are not the hatches better when hens of such a nature are selected as setters? How much care is taken that biddy be contented and happy while setting? No one succeeds well in doing what he does not like. So with biddy; if she does not like the nest and is disturbed as she often is. Would you expect her to do well then?

We might take up many details and go into the matter further to demonstrate the points we wish to make. Enough has been said to start you thinking. When natural laws are more closely followed you will find that greater success will be attained. Too much that is artificial has been introduced in poultry work.

## DISCOURAGING.

If the hen knew that she was trading 20 cents' worth of eggs for a nickel's worth of chicken feed she would probably quit cackling.—Minneapolis Journal.

## SUMMER CARE OF THE FLOCK.

WHEN the writer of this article first became interested in poultry keeping, like many others, he believed that the larger part of the yearly profits on eggs depended upon those produced in winter, and that to make any special effort to secure extra good laying in summer was, so to say, a questionable proceeding. If I remember rightly, there are still a few writers who strongly contend that summer eggs are unprofitable, and urge the advisability of giving the hens a rest during that season in order that they may be in the best possible condition for good laying in fall and early winter.

I could never quite agree with such a point of view. Hens given a rest from laying during hot weather will, as a rule, lay better in fall and winter than if they had been forced up to the extreme limit of productiveness previously. At least this has been our experience with a few hens allowed to hatch and raise a brood of chicks in early summer. However, when we read that eggs, produced in summer fail to pay for feed and care and yield a substantial profit besides, we are forced to conclude that the writer has formed an opinion not justifed by the facts of the case.

Ninety per cent of those keeping poultry make their hens pay in summer if they make them pay at all. Some people can't seem to get eggs at any season except spring. Any kind of a hen will lay well under most any kind of conditions during the natural laying season, but when hot weather begins to arrive, most hens, unless given extra care and attention to keep them laying and in good condition, are apt to slack up. It is for this very reason that eggs increase in price on the approach of summer. Those looking for more profit should take advantage of this condition and do their best to secure a good egg yield all through the hot weather. To show how this can be done in the easiest possbile manner, is our purpose in writing this article.

The keynote of success in getting eggs in summer dates back to how the hens were handled in the spring. If they have laid heavily at that time, as nearly all hens do, it is quite likely that they are somewhat out of condition, run down in flesh and otherwise debilitated, unless special pains were taken to see that they were well fed when laying heaviest. If such is the case, the first thing to do is to get them back to normal condition without delay. If thin in flesh, feed corn freely, with moderate exercise.

But a much better way would have been to do all this in the spring by seeing that your hens were fed enough then, and not allowed to get out of condition. It is almost impossible to overfeed hens laying heavily in the spring, if they are given a chance to take a reasonable amount of exercise. When I say that the hens must be well fed, I am not at all sure of convincing some people with the true meaning intended. I have this fear because there seems to be such a great difference of opinion among novices as to what constitutes good feeding. In our vocabulary it means giving the fowl or chicken all it can eat and keep in good condition. I believe that for every fowl overfed, ten are not fed enough. Of the two evils, I would much prefer the former by a good deal. It is easy enough to avoid either extreme—much easier than one would be led to suppose after reading some of the orticles relating to the "science of feeding," and "balanced rations," and all such nonsense. The beginner would do well to let all such stuff alone, unless he is absolutely sure of his ability to feed practically and get results. Then if he wants to he may investigate the science of the subject, but I venture to suggest that what knowledge he may acquire in this connection will hardly be of any earthly use to him.

Another class of writers the novice in poultry keeping would profit by letting alone, is composed of those who are always telling of the dangers lurking in feeding corn to fowls. Personally, if I were reduced to the necessity of feeding a single kind of grain exclusively, I would rather it were corn than wheat. I feed wheat also, but in much less quantities than corn. Corn is not only a good grain, but is also so much cheaper than wheat that it might be profitable to feed considerable quantities of it even if it did not give quite as good results. Corn cannot safely be fed as freely to laying hens in hot weather as in winter. It is the failure to recognize this fact that is responsible for many failures to get good results from feeding corn in summer. Corn is heating, and has a tendency to fatten readily unless provision is made for offsetting this difficulty. The keeper can easily control this condition by giving the fowls a chance to take easy and regular exercise. Our method of feeding for eggs in summer does not differ materially from that used in winter, except that less corn is used in the ration.

Our hens kept for supplying eggs for market are in flocks of 25 each, with yards 30 feet wide by 135 feet long. This gives them a fairly good grass range, but not sufficient to keep the whole yard in grass. The next yards we build will contain not less than 6000 square feet. This gives each hen something over 200 square feet, which is what we consider about the right allowance of yard room.

We feed a mash in the morning made as follows: Three parts bran, two parts corn meal, one part best middlings or red-dog flour, one-half part meat meal. When we can get good beef scraps, we use that instead of the meat meal, keeping it in a hopper constantly before the fowls. The

**Coulson's**

**No 3 Condition Powders for Poultry?**

A first-class tonic and conditioner like ***Coulson's No. 3 Condition Powder*** is of great benefit to the chickens, especially when used at this time of year.

***Coulson's No. 3 Condition Powders*** will prevent diseases, by keeping the flock in a thoroughly healthy condition. By the same means it will keep them laying longer into the molt, and their healthy condition will enable them to molt quickly and commence laying at an early date. As it contains no injurious stimulant, it can be used with perfect safety at all times and for this reason is fed in large quantities by numerous poultrymen.

**It Contains No Cheap Filler**

In buying a bucket or sack, therefore, every pound is of value to the chickens, and will give you large returns for the money invested.

For sale by all dealers or at factory.

# Irrigation and Forestry

## NATIONAL AID TO IRRIGATION.

A GREAT many Easteru farmers have always insisted that it ls unfair to them, or the descendants of them, who, with extreme toil, and often in great peril, at their own cost literally hewed their way through a wilderness to clear and improve their own farms, to expose them to the competition of what they call "state aided farmers" They bitterly opposed the passage of the national irrigation act claiming that the public lands the proceeds of whose sales are devoted to irrigation were the property of the whole Nation, so that to the extent that Eastern farmers have interests in the public lands their own property is wrongfully taken to pay the cost of creating unfair competltion. To the argument that these new irrigated lands devoted to intensive and special farming will make markets for the products of Eastern factories whose workmen will consume the products of Easteru farms they Jenied that this indirect benefit would offset the damage of this unfair competition and insisted that not for a generation, at least, would there be any necessity for opening up the arid lands to settlement. They pictured to themselves the whole continent west of the 100th meridlan cut up into small farms, irrigated at their expense and freely given away to whomsoever would take them.

Since the passage of the act the Eastern agricultural press does not devote so much space to the subject, but so far as it refers to it, the same views are expressed and with the same bitterness. Some of them have learned that instead of irrigating the whole western half of the continent, comparatively small portions can ever be irrigated. So far from "giving away irrigated farms," the cost to the settler for an improved farm will exceed the price at which most farms can be bought already improved in the Atlantic states, and settlers of small means are not likely to be able to meet their payments, so that Congress will doubtless be compelled to extend the time of payment. In fact, it should have been recognized at first that ten years was too short a time. All other countries which assist farmers in such ways give a full generation for the payment, but they charge interest, which we do not. In the end all these irrigated lands will become very valuable—some much sooner than others—but in the meantime, for the "poor man" there will be hard pioneering, and with all that can be done by irrigation, population will increase much faster than agricultural products. The farmers of the United States are the most prosperous class of our people and their future is safest. The "competition" of the irrigated lands in the arid states is not and will never be noticeable The management of the national irrigation fund is not wise, but it is as prudent as that of our other governmental functions. Local insistence doubtless is compelling some projects to be developed before their time. Official enthusiasm aided to cover the whole field as nearly as possible at once. Congress erred in requlring payments to be made In ten years without interest instead of thirty with interest, and in permitting any one to settle on the land and do with it as he pleases, instead of as as in other countries, requiring of settlers without means some evidence of fitness and compelling them, until some payments had been made or substantial improvements made and paid for, to work under direction, paid for by those directed. All that, however, is quite In accord with our happy, go-lucky American way and was to be expected The nation, like other nations, will grow wiser as it grows older. We shall have some costly experience and in due time shall profit by it. But with all our awkwardness and extravagance, the whole country will gain by the national conservation and development of national domain.

We have before us an address delivered by Gilbert M. Tucker, editor of the Country Gentlemen, before the National Farmers' Congress in 1902 in which certain evil social rural tendencies are noted whlch it was alleged that national aid to irrigation would Intensify. A farmer "of considerable means" is quoted as follows:

"The fact of it is, the drift of things in this country ls steadily reducing our farmers to the condition of the peasantry of the old nations of Europe, a condition in which sustenance, of a very plain sort, may reasonally be expected, but in which there is positively no hope for anytning better than unceasing toil, no opportunity whatever of accumulating the most modest competence."

Mr Tucker amplifies this and deplores the increasing tendency to landlordism and tenant farming. Doubtless it is to be deplored. In no other land is there to be found the counterpart of the independent American farmer tilling with his own hands a substantial acreage owned in fee simple. The type has existed elsewhere, but has not been able to persist. It is not certain that the American type will persist, but if anything will maintain it it is settlement under the national irrigation act, when water will be supplied only to those owning and living on the irrigated farm, and to them only on a strictly limited acreage. Extensive landed estates worked by tenants will never be possible under a national ditch. It would seem that Mr. Tucker has a subconscious feeling, probably not recognized by himself, that there is after all a real fitness of things in the "gentleman farmer" earning his bread by the sweat of other men's brows, for later in his address he says, referring to these irrigated lands:

"A second channel of mischief is the absorption of the new lands by the men and women who ought to supply, and in the normal condition of things would supply, an abundance of labor, at moderate wages for established farmers. The demand for really efficient help, at prices that farmers can afford to pay, is left largely unsatisfied, to the injury of the farming interest, and perhaps most of all to the overburdening of the wife of the small farmer with tasks of which hired servants could greatly relieve her—by the facility with which the persons who ought to supply it can go West and become farmers on their own account, your property and mine being freely offered them for that purpose."

Somehow that sentiment does not seems to comport well with the anxiety displayed earlier in the address for the preservation of the typical American farmer.—San Francisco Chronicle.

**Why Buy the International Auto?**

**Because** It saves money in operating expense.

**Because** It avoids 90% of the ordinary automobile troubles with pneumatic tires—no punctures, no blowouts.

**Because** Air cooling does away with a cumbrous water cooling system, and obviates leaking radiators.

**Because** The engine is built for long service and to eliminate repairs.

**Because** Of the many other reasons that we want to tell you of in detail.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Bloody Milk.

I have a cow that has been giving bloody milk for ten days. Can not account for it as she has had no ill treatment to my knowledge. Her feed consists of bermuda, salt grass, alkali weed and some alfalfa. She aborted four months ago.—Subscriber, Laton.

As this trouble started suddenly and not at the time the cow freshened I should think it was more than likely to have come from a bruise and if so it will pass away in a short time. Cows often hurt themselves in getting up and down for they slip around considerably. There may be udder lesion as this cow aborted and then gave bloody milk. It is safe to test all cows that abort as the tuberculin does them no harm and it assures the owner that the udder is not affected by a tubercular abscess. There is nothing that is a cure for bloody milk except nature. If the cow passes the test the milk may be used for feeding the calves.

### Silo Stack.

How can the freshly cut stalks of sweet corn be best converted into a winter feed for milk producing cows? To make silage is it necessary to have a tight silo? There is a good deal of waste when cured in the shock and the stalks fed whole, but on the other hand it might not pay to convert a couple of acres of corn into silage for two cows only. Would green alfalfa mixed with corn make a more balanced ration?—C. T. P., Redlands.

The question as you state it is exactly the reason that people build silos or buy shredders for the dry corn fodder. There is no way that it can be used successfully without waste, except by one of these methods. We have at times put in layers of green corn ten inches thick in the hay stacks or in the mows and covered them with a good four feet of dry hay. This saves the corn from rotting, if the weather has turned damp, but it does not cure the corn so that the cows will eat it up clean. When the same corn is siloed there is absolutely no waste if fed with any degree of intelligence. The part left by the cows is all consumed by the dry stock. It is absolutely neccssary that a silo should be air tight on the sides. The silo stack is sometimes used by stacking the corn on a foundation of hay, after it is closely piled up and tramped down, then again covering it heavily with hay and covering the sides three or four feet deep in the hay. Then weight it with heavy weights on ropes. Boards are laid on the top and the iron weights are tied on ropes across the boards hanging free at each side. These stacks are common in Southern Germany and are said to preserve the feed quite well. The stack should be twice as high as it is broad and there should be at least six feet of hay on top. It is fed out by cutting down on the end with a hay knife each day's feed. I have never built one of these stacks myself but have seen many of them in use. Two cows would not justify the building of a silo, as at least two inches must be fed off each day to prevent the silage from moulding. As to the question of mixing the alfalfa and corn in the silo, it is better to keep them separate until you come nearly to the end of one kind of feed. Then we like to begin to throw in the other, so that there will be a little sloping off from one kind to the other without a sudden change. No animals will do well when the feed is abruptly changed on them. I sometimes think if we would watch ourselves we would find it equally true that the digestion is easily disturbed when one kind of food is suddenly eaten to excess—M. E. S.

### Fence Post Dip.

What dip can I use for preserving fence posts? Is coal tar good?—T. H. S., Los Angeles.

A dip of creosote is considered the best preservative for fence posts. To obtain the very best effects it should be heated and the posts dipped up to a few inches above where they will project above the ground. This will cost about ten cents per post. Coal tar heated and used as dip is also excellent. In fact, any similar mixture which will keep the moisture from the wood is all that is needed. The creosote possesses in addition to this property that of a preservative.

### Late Cultivation.

Back east we were advised not to cultivate after a certain time in the fall. Does that rule apply here? My orchard is of young deciduous trees. —T. H. S.

We think there is more danger in allowing young trees to go uncultivated and unirrigated late in the season than there is from overcultivation. For instance, trees which are now beginning to suffer for water, if allowed to go without further irrigation or cultivation, become dormant before their proper season, and then an early warm spell, perhaps in January, with plenty of moisture in the soil, causes them to spring into bloom and perhaps leaf out. Later cold weather again causes the tree to become dormant, and great injury will be shown at the proper leafing time. It is barely possible that irrigation and cultivation may be kept up and late fall growth stimulated so that slight injury may be caused by early fall frosts, but this possibility is so remote that we would prefer risking this contingency to the other.

### Black Eyed Beans.

Is there any difference between black eyed peas, black eyed beans and cow peas? Will any of them survive sharp frosts? I am now preparing to plant them for cover crop. —Subscriber, Bakersfield.

The so-called black eyed pea and black eyed bean are the same, at least in the minds of most California bean ranchers. The cow pea is materially different, being a stronger growing vine. The stalks sometimes grow nearly as large as the finger and twice as high as the ordinary black eye. A hard frost will discourage any of them. See leading articles in last week's issue regarding best seed for cover crops. Cow peas make a fine summer cover crop.

### Kaffir Corn.

Have been told that kaffir corn in second cutting is poisonous to stock. Is there any danger in feeding to horses or cattle?—C. S. C., Anaheim.

There have been a few, very few, times when the sorghum plant has gathered up prussic acid into its leaves. These times have been too rare for us to abandon a valuable cheap feed which has caused not a thousandth part of the loss that has come from alfalfa bloating. Do not overfeed until the stock are used to it. We have fed freely first, second, third and fourth growth a season without harm.—M. E. S.

### Output of Beans.

Is there any old crop of small white beans in stock in California? The crop in this county is fair but the acreage very small. I think the new crop will go to eight cents before spring. Have contracted for five cents.—G. W. L., San Luis Obispo.

We have made inquiry as to hold over crop and as to possible prices and find the old crop is light, but eight cents before spring is certainly a liberal expectation. They were quoted in last week's Cultivator at $6.50 and $6.75 in Los Angeles and $7.00 and $7.25 in San Francisco, but it must be borne in mind that these are the wholesalers' prices in those two cities. The jobber who disposes of them to the wholesaler has of course made something at this quotation. A five cent contract to the producer is generally thought an exceptionally good price.

### Salt Bush.

What kind of weed is the enclosed? It is very thick this year. Some of it grows to a great size, and when ripe breaks off at surface of ground and blows around like tumble weed.—E. L. P., Macdoel, Siskiyou Co.

This was referred to Dr. A. Davidson, botanist of Los Angeles, and he writes: "This plant is a common one in California and is one of the numerous salt bushes native to the Coast, found especially in alkali ground. It is atriplex microcarpia."

### Stunted Pig.

My pig four months old is stunted. Eats well, but cannot stand long and staggers.—B., Hanford.

As I do not know how long this animal has been afflicted in this way it is hard to tell what is the matter.

**Buy Fall Chicks**

They are the easiest to raise, and will begin laying when the eggs are high. We will have off a BIG HATCH every week, send today for price list, and full particulars. If you buy chicks now and make a small deposit you can get them any time and at the same old prices. Later when eggs get high we will have to raise the price on chicks. Hadn't you better send in your contract now and buy at the low prices while you can. Later you will pay more money for the same chicks. We are giving you a chance. Better investigate today. Our chick book is free.

THE OLDEST SAVINGS BANK IN CALIFORNIA

**Eucalyptus Trees**

All sizes for Fall and early Spring planting. We make special prices on seedlings, 500 to 1,000 trees to a flat. We have a quantity of hardy stock for bare root planting, can be handled at small expense and give satisfaction. Correspondence solicited.

The SOUTHARD NURSERIES, Redlands, Cal.

COULSON'S POULTRY FOODS MADE IN PETALUMA GUARANTEED SOLD EVERYWHERE

If he was mine, as he is a stunted specimen, I should simply destroy him. If the domestic animals have not vigor and strength they are not worth raising. The cause is probably rickets and that is prevented by feeding the sows bone making materials. If you feel this pig must be doctored try feeding him a pound of bran with a heaping tablespoon each of sulphur, ground bone, and charcoal added to it.—M. E. S.

### Milking Machine.

Will it pay a man who wishes to milk a string of 20 or 30 cows and do all of the work himself, to put in a milking machine?—W., Holtville.

This is a question on which there might be a difference of opinion. I personally have not seen the desirable milking machine. The reason I have not taken it up is that I have never seen milking machine cream that did not have a taint from the machine, a smell and taste of oldness that was not pleasant and indicated that the cleanliness of the machine was not perfect. While this may be the fault of the operator, I still think it is apt to be the case whenever the machine has been in use a long period. I believe that the milking machine will come alright and that today it is probably as good as the automobiles were four years ago. See how they have improved!—M. E. S.

### Fleas.

Your correspondent at Auld, Riverside county, asking for an unfailing remedy for fleas should get 3 or 4 sheep and keep them around infested premises. The wool will catch the last flea. Failing this (as not convenient), he can use gas lime as the next best remedy, simply sprinkled around on the ground will fix them.—L. D. H., Greenfield.

### Thoroughbred.

If a thoroughhred sire is bred to common cows and their offspring is again bred to a thoroughbred, when, if ever, are their progeny rated as thoroughhreds?—P. A., Fresno.

Never. When an animal is not full hlood it simply is a grade and cannot he made anything hut a grade. The word thoroughbred is used by stockhreeders as applied only to the running horse. All other animals are called purebreed or full hloods. To be this both sire and dam must he registered in an official hook hacked hy an Association before the offspring can be entered. The hest Associations are run hy breeders themselves joining in and becoming members. In return for the membership fee they pay they receive the herd books as issued by the Association, and also a reduction of the fees for registering the animals they hreed. The Government recognises these associations and their records have a standing in courts.—M. E. S.

### Soft Scale.

I have red scale on grape fruit tree which nearly destroyed it last year. What shall I do to save the tree?—E. H.

Accompanying the above letter was a grape frult leaf badly infested with soft brown scale. If that is the "red scale" which our inquirer means, we would refer him to the answer hy Mr. Pease to a similar query in the issue of Sept. 9, page 258.

### Eucalyptus for Fuel.

Please inform me which is the best variety of eucalyptus to grow for fuel in Santa Cruz county, and where can I obtain plants or seeds?—L. N., Santa Cruz.

Not knowing the conditions as to temperature in the section, we could not answer that question with any degree of definiteness. If the thermometer does not register below 22 or 26 degrees, the blue gum (globulus) would probably be the best. It is the most rapid grower we have and where the frost does not affect it, is by all means the most desirable. In the San Joaquin Valley we believe the red gum is preferred, especially in the lower sections where there is a good deal of frost. Plants or seeds may be secured from any seed man or nursery man advertising in the Cultivator.

### "Sulphuret."

No questions anwered unless they are signed or accompanied by signature of the writer.

## HARVESTING THE BIG CANADIAN WHEAT CROP.

Harvesting the one hundred and thirty million hushels of wheat in Western Canada is not without its dramatic and humorous sides. One of the incidents is graphically described this week, by the Manitoha Free Press in this way:

"A procession of ten passenger trains, each of them from 18 to 20 coaches in length, pulled out from the vicinity of Montreal and Toronto last Thursday and filed at top speed around the great curve of Lake Superior on the C. P. R., headed for the West. Laden with a cosmopolitan mixture of 6,000 harvest hands, jumbled together as indiscriminately as one would shuffle a poker deck, they arrived in Winnipeg hetween Saturday at noon and Sunday at noon. People in the vicinity of the depot knew that they arrived, that is, those who have not been deaf since infancy, for the advent of every unshaven and begrimed battalion was announced by a wild cheer that emanated from the first coaches and spread into a deafening roar as the train pulled into the trainshed and the following coaches took up the cry of pent up relief and gladness. It was more like the arrival of a crowd of holiday spirits given a respite from work for a day, than one expectant of many a hard day's work in the harvest field."

When the green stalks are given to hogs care should he used to prevent cattle from having access to the woody fiher which the swine will leave after chewing the stalks. Pigs relish chewing the stalks for the sweetness in it, hut leave enough saccharine matter in the fiber to make it attractive to cattle, especially the younger stock. This fiher is indigestible, and the cattle, if allowed to pick it up, will frequently eat a sufficient quantity to cause impaction and harmful if not fatal results. It is not safe to let cattle into yards where swine are given green corn stalks.—From Coburn's "Swine in America."

Even when corn is high the relative price for pork frequently makes it the cheapest feed for finishing; fifty-cent corn is not expensive feed for six-cent hogs. Up to the last six weeks of feeding, wheat, rye or other cheaper suhstitutes may be used with grass, but in the ordinary course corn will be the best dependence for the close of the fattening period.—From Coburn's "Swine in America."

# Classified Liners

Rates 1½ cents per word per issue No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

### MISCELLANEOUS.

THE ANCHOR EGG SEPARATOR works perfectly; no well regulated hotel or household can afford to be without it." So says Delmonico's Chef. **Pioneer ROOFING**

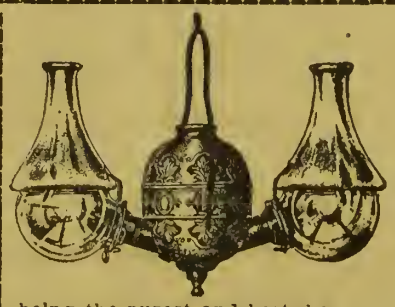
We tell you to put on a "Pioneer Roof," and forget it. Needs no paint or repairs. Sun proof and rain proof. Not affected by extremes of heat or cold. Suitable for all kinds of buildings—pitched or flat roofs. Comes in handy rolls. Easy to lay—anybody can do it—no special tools needed.

**Now then—Let us send you samples, a copy of our 32-page Roofing Booklet and name of our nearest agent.**

**PIONEER ROLL PAPER COMPANY**

**DEPARTMENT 11-F LOS ANGELES, CALIFORNIA**



**Angle Lamp**

**The Light That Never Fails**

Thousands in use all over the country. A good light is the greatest pleasure and the first necessity of every home.

The only lamp on the market that is sold under absolute guarantee.

Remember, the light from Kerosene is the light science has agreed upon as being the purest and best, because it is soft and mellow and restful to the eyes. Here are a few of The Angle Lamp Merits:

**NO UNDER SHADOW. NO SMOKE, NO ODOR, LITTLE HEAT. GREAT ECONOMY—COST LESS TO BURN** than an ordinary lamp. As easy to operate as gas or electricity, and better than either. **ABSOLUTELY SAFE** under all conditions. Lighted and extinguished like gas. Burned **HIGH** or **LOW** like **GAS** without a trace of odor. And a **BRILLIANT,** soft, steady, shadowless light—but this you will have to see to appreciate.

The lamp as shown in cut burns 22 hours on 3 quarts of oil.

***Send for Illustrated Catalogue with Prices***

## THE PRAYER-PERFECT.

Dear Lord, kind Lord,
  Gracious Lord, I pray
Thou wilt look on all I love,
  Tenderly today!
Weed their hearts of weariness;
  Scatter every care
Down a wake of angel-wings
  Winnowing the air.

Bring unto the sorrowing
  All release from pain;
Let the lips of laughter
  Overflow again.
And with all the needy
  O divide, I pray,
This vast treasure of content
  That is mine today!

—James Whitcomb Riley.

## THE RED DESIRE.

THE Tracy's goat was well known all over the ward for a philosopher and an optimist. Trouble went not with his long, white beard, and laughter followed in the wake of his red express.

Before his coming there has been strife and unhappiness in the house of Tracy. The baby had been peaked and fretful; the twins had fought too much even for twins; Mrs. Tracy had brooded too long on the hallowed memory of her famous ancestors, and Tracy himself lost his rotundity of face and expansiveness of smile in the constant struggle with butcher and baker and candle stick maker.

But with the coming of the goat—bright fortune smiled. Daniel Alexander Tracy, the baby, rode the animal's back into the sunshine of health and rosiness. The twins had ceased their brawling to devise quaint harnessing schemes for the new pet. Mrs. Tracy forgot the blessed dead and she made a beautiful blue ribbon collar for the goat, which he afterward chewed off; and Tracy laughed the rotundity back into his face, and with it the energy and resourcefulness into his system. So they named the goat the Knave of Hearts, and everybody waxed fat and prospered.

The Knave of Hearts had very peculiar notions as to diet and forage. For instance, he had always displayed a strange love for things of blood red hue. He had been known to nibble for hours at a crimson painted lamp-post, and his favorite brand of canned goods wrappers was the kind that show the huge scarlet tomatoes—the twins were quite sure the Knave also ate the can. The O'Briens next door had to guard Mr. O'Brien's vivid shirts on the clothesline regularly every Monday, and on Decoration Day the Knave made a tidbit of half of the flags on the block.

Things were in this happy state when Mrs. Tracy came into possession of the Hyderabad Ruby. It was a heritage from the blessed ancestors, and the presence of the splendid, red gem seemed to bring her back to the unsatisfactory frame of mind that had prevailed before the coming of the Knave of Hearts. She would sit and fondle the bauble, neglecting Daniel Alexander, the baby; ignoring the noisy twins; slighting the goat, and vexing Mr. Tracy.

Things became worse and worse until Mr. Tracy arose in wrathful rebellion. "Gimme that red devil-glass!" he commanded.

"It's throwin' it into the ash cart I'll be after doing this minute!"

"No—no—no!" blazed Mrs. Tracy.

She arose and held the radiant, red gem between her fingers, tightly clenched behind her back.

"Gimme the hoodoo-joo!" ordered Mr. Tracy.

The baby cried heartrendingly; the twins tore each other's curly locks. The goat, walking in from a light repast on Mr. O'Brien's crimson sweater, looked at the antagonists.

"Gimme the evil sparkle!" cried Mr. Tracy; and the Knave of Hearts walked around and nipped the dangling red bandana from his pocket.

"Never in the world!" retorted Mrs. Tracy; and the Knave with an eye to smaller delicacies, strolled around and licked at her hands.

"Heavens!" gasped Mrs. Tracy. "The ruby has disappeared!"

"Then praise be!" exclaimed Mr. Tracy; and he began to smile expansively. The baby caught the contagion and crowed shrilly. The twins ceased to battle and brought out the new string harness. The Knave of Hearts faced Mrs. Tracy and wiggled his patriarch beard very teasingly.

"He has swallowed the Hyderabad ruby," said Mrs. Tracy with a sigh of relief. "I don't believe I'm sorry."

"It's the blessedest thing the Knave ever did!" declared Mr. Tracy.

Afterwards they treated the Knave of Hearts to a delectable mass of the baby's faded, red hair ribbons.—Ex.

## HELP IN EMERGENCIES.

FOR THE little accidents that seem more prevalent during warm weather it is well to have simple remedies at hand, along with court plaster, bandages and a ball of knitting cotton, as these will cost little and be in constant demand for cuts, bruises and the sundry small accidents every family is heir to.

When any foreign substance gets into the eye, beat up the white of an egg with about a teaspoonful of powdered alum, spread this on a cloth and lay it over the eye. This will usually collect any foreign substance and bring it to the surface

An excellent salve for poison oak is made by mixing well together equal parts of lard and quinine and applying to the affected parts.

Every mother should have a bottle of boric acid solution where she can get it at a moment's notice as the boric acid is perfectly harmless and is exceedingly beneficial as a dressing for cuts and wounds and the acid can be used freely either in powder or dissolved in water. The solution is made by dissolving two heaping tablespoonfuls of boric acid in a quart of hot water.

For insect bites moisten borax powder to a paste and bind over the affected parts and keep the bandage moist with the borax solution until the soreness is all gone.

For a sprain take some peach leaves, bruise them well and bind them on securely and they will give almost instant relief.

For hiccough, heat some sweet milk to near the boiling point and give in small quantities at a time until the hiccoughs subside.

For scalds or burns, cover with baking soda, wrap closely with a soft

cloth and saturate the bandage with coal oil.

These simple remedies have not only saved doctor's bills but much suffering and very often loss of time from work, and every woman should have a knowledge of the simple home remedies and how to use them.—Martha.

### A NEW WAY TO CAN TOMATOES.

Last summer I tried a new method of canning tomatoes, and it proved so satisfactory that I want to pass it on. Scald and peel the tomatoes as usual. Have the cans sterilized, place the raw tomatoes in them whole, pour boiling water to fill the cans, running a knife around in the cans, so that all the crevices are filled, then put on the cover. Place the cans in a boiler or large vessel, pour in boiling water till it reaches the neck of the can, put the lid on the boiler, wrap it with a blanket or rug, and leave until the water is cold, which will be next morning. The cans are then ready to put away. I did not lose a can out of forty quarts. When the cans were opened, the tomatoes were whole and firm enough to slice easily.—Woman's Home Companion for September.

### DO YOU WANT TO BE BEAUTIFUL.

Then see that your room has plenty of fresh air at night. You should have your windows open both at bottom and top. If you do not like a draft upon the bed, made a folding screen for protection. Any girl may do this for herself. All she needs is an old-fashioned two-leaved clothes-horse, over which she may fasten selisia with small brass-headed nails. or if she prefers she may paste on it a pretty paper to match that of her room. Begin with an inch or two if you have been sleeping in a close room, and gradually increase the space of your open window, always keeping an extra cover at the foot of the bed for the chilly time which comes toward morning.

Remember, that fresh air during sleeping hours is absolutely essential to health and beauty.

### JUST BE NATURAL.

Do not make yourself unhappy if you cannot change old furniture for the modern style your heart desires. First study closely possibilties of what you have. Learn to group like things together. Study harmony of color and design. Do not allow colors which do not harmonize next each other. In selecting floor coverings and wall paper, shut your eyes to florid patterns in bright colors. Do not "sky" your pictures. Bring them down where the eye can enjoy them without stretching the neck. It is the warm, cheery, hospitable spirit that makes a room beautiful. Just be natural.

Always fill your cup with love and cheer for your home people, giving the overflow to outsiders.

### SOAP.

This is a reliable recipe for making soap: To eight pounds of grease take two cans of lye and seventeen quarts of rain water and one-fourth pound of rosin and one-half pound borax; then boil for an hour or a little longer. Add a quart of water when finished boiling.

In Japan paper is used for almost everything, from the silver-figured partitions of the Buddhist temple to the rude hut walls of the laborer; from the silk-like vestments of the priest down to the rainproof shield of the traveler. In fact, the ingenuity of the Japanese is only matched by the variety of uses to which paper may be adapted.

### THE CROWNING INDIGNITY.

Just 'cause my brother Alfred, he
Is two years older 'an me,
W'y ever'thing he gets 't's new
They give to me when he gets through.
I try my best to not to grow
An' catch up with his old things so,
But when he gets too big for clo'es,
W'y, I've growed just exactly so's
They'll do for me—an' then I've got
To keep on wearin' 'em a lot!

My brother Alfred's pants just wait
An' never get tored in th' gate
Or ripped on nails, or wored out none
Until my catchin, up is done.
When he gets new ones, my ma, she
Says his old pants will do for me,
An' Alfred grins, an' looks so glad
It always makes me awful mad!
An' ats' th' way, it always goes—
I even get his underclo'es!

But now it's worse an' ever! I'm
Just mad clean through and through
this time.
It's got to more 'an I can stand—
This gettin' his things secon'-hand!
An' I told ma 'at I think it
Is purty near th' time to quit.
My brother Alfred, he's been sick
With measels—he was speckled thick,
But now he's through with them, you
see,
He's gone an' given 'em all to me!
—Harpers Magazine.

### EASY LIVING.

Dar's two times in de year dat Gord
Made for de nigger sho',
Two times when he's so rich he don't
Ask Gord for nothin' mo':

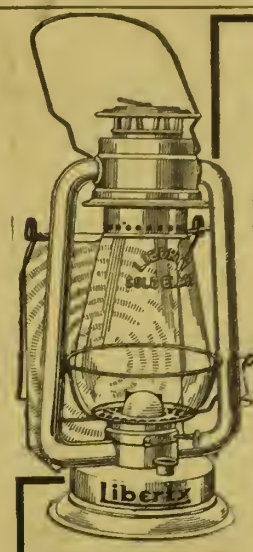
Blackberry time is one, for den
He neither hoes nor sows;
De nigger knows his daily bread
Right on de bushes grows.

De other's Watermilion time;
An' den—Lord bless your soul!
Bof bread an' water grows for him
In one big cool green bowl!

### LUCK.

The boy who's always wishing
That this or that might be,
But never tries his mettle,
Is the boy that's bound to see
His plans all come to failure.

Progress in the sense of acquisition, is something; but progress in the sense of being, is a great deal more. To grow higher, deeper, wider, as the years go on; to conquer difficulties and to acquire more and more power; to feel all one's faculties unfolding, and truth descending into the soul—this makes life worth living.—James Freeman Clarke.



A Bigger Light
A Brighter Light
A Stronger Light
A Longer Light

Liberty Lanterns

A special wick-regulating device prevents a flame with "horns" on the sides, it can be turned up higher than others. Air supplied in just the right proportion, it gives a brighter, whiter, stronger light. Burns longer with less oil than others.

**Prices from 60c. to $3.50.**

Don't be persuaded to buy the "just as good" kinds. Buy the best —LIBERTY LANTERNS.

### Hay.

Scott, Magner & Miller say

Arivals of hay for the week have been 4500 tons. This is an increase of about 10 per cent over last week's arrivals. Our market this week has been badly interfered with; Monday having been a legal holiday on account of its being Labor Day, and Thursday being another holiday on account of Admission Day, have interrupted the week's business and broken it to such an extent that it has rather demoralized the conditions of the market for the week.

Present conditions show plainly that choice varieties of hay are rapidly being cleared from the fields, and that this class of hay will command a comparatively better figure than medium and poorer varieties until the fields are cleared. There are extensive holdings of the poorer varieties of hay in many parts of the country tributary to our markets which are endeavoring to find sale here during this month, and which fact, being well understoond, is a standing menace to the stability of the present market.

Alfalfa hay continues to arrive freely, and the feeling on this article is a little weaker than it has been at any time this season. No. 2, or any off-grade alfalfa is slow to dispose of, even at comparatively low figures.

This week's quotations are:

Choice wheat hay .....17.50@18.50
No 1 wheat or wheat & oat 16.00@17.00
No 2 wheat or wheat & oat 13.50@15.00
Choice tame oat .....16.00@17.00
Other tame oat .....12.00@14.00
New crop wild .....11.00@14.00
Stock hay .....8.00@9.00
Alfalfa .....10.00@13.50
Straw .....55@65

### Grain.

Wheat No. 1 .....1.70@1.75

Mixed feed per ton .....25.00@30.00
Shorts .....31.50@33.00

## Citrus Market

LOS ANGELES, Sept. 15, 1909.

It cannot be said that there is any material advancement in the orange market but the general tone is stronger and the six or seven hundred cars yet to go forward will probably command prices satisfactory to the growers. These will largely be cleaned up within the next four weeks though there may be a few cars held for experimental shipment later. These may go in competition with the earliest colored navels. The fruit as a rule is of good quality and the market is receiving practically all of it satisfactorily.

Lemons are being taken up as fast as offered. For a time dealers were a little slow in buying owing to the expectation of a lower market, but the shortage of forcigns and the lessening of the shipment of the lower grades is giving a much firmer tone to the market.

**SHIPMENTS.**

Shipments of citrus fruits to date this season total 36,593 cars. Of this 30, 644 were oranges and 5,949 lemons. To same date last season there were 26,631 cars of citrus fruit, of which 22,141 were oranges and 4,490 lemons.

---

NEW YORK, Sept. 10.—Nine cars of oranges sold. Market about steady. Raining.

## SUMMER CARE OF THE FLOCK.

(Continued from Page 279.)

best way to mix the mash is to pour boiling water on the meal to make a thin mush, and then stir in the other ingredients. Feed while hot, or as soon after mixing as convenient, giving all they will eat up clean and quick.

At noon a quart or a little less of wheat to 25 hens and about 5 p.m. two quarts of cracked corn, or in extreme hot weather partly or wholly wheat. All grain fed is scattered broadcast over the grass in the yards, so that the hens get considerable exercise picking and scratching for it. This year we are feeding in litter indoors, so as to give the grass a good start by keeping the fowls off at least a part of the time, something not possible when they are fed in the yards.

On extremely hot days we feed the mash at noon, giving grain in litter in the morning, so as not to compel the fowls to work outdoors in the warmest part of the day. When feeding the mash at noon, we feed it in smaller quantities than when it was given at the usual time.

Up to this point I have said nothing about the general care of the flock. The most important thing to look after here is to see that the fowls have an airy, well-ventilated place to roost at night and a shady place out of doors in which they will spend the warmest hours of the day. Every window in the poultry house that can possibly be removed should be taken out and all doors opened as much as possible. For shade, fruit trees are probably the best, but any sort of shelter, provided it fulfills the requirements, can be used instead.

In warm weather lice multiply rapidly if given only half a chance. It pays to be on the watch for these pests. Unless the fowls have been very much neglected, elaborate precautions are not necessary. It is well to kerosene the roosts once a month or oftener. Having done this and provided a suitable place in which the hens can dust themselves, it will be found, I think, that they will keep themselves reasonably free from lice.

The above method of feeding and caring for the flock in summer I don't suppose contains any points differing materially from that of most successful poultrymen. With us it has proved satisfactory, giving us a good egg yield throughout the summer, and our hens undergoing this treatment have laid unusually well in the fall and winter as well. It is our ardent wish that some reader may be benefited by a careful perusal of this article.—Commercial Poultry for July.

# You Know You Want a Separator

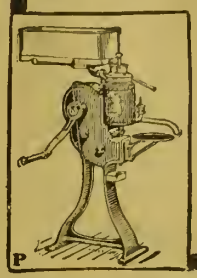
and the *cleanest skimming* separator
and the *most durable* separator
and the *cheapest* separator

**United States Separators** are the best and hundreds of thousands of satisfied users say so.

**Are cleanest skimmer** as proved at the Pan-American in competition with other separators—**.0138 of 1 per cent average for 50 tests.** This test has never been equalled.

**Are most durable** as years have proved it—some running continuously and giving complete satisfaction for over 17 years.

**Are the cheapest** because they wear longest and require fewest repairs.



In nearly every dairy section of the country there are United States Agents. These men have confidence in the United States Separator. They know what it will do. They will grant a free trial to any one who means business, and give favorable terms in case of sale.

Write a postal for agent's name and catalogue No. 20

**VERMONT FARM MACHINE CO., BELLOWS FALLS, VT.**

**Prompt Delivery Assured** California Customers from Stockton warehouse. No delays. Address all letters to Bellows Falls, Vt.

## Business Notes

### HUMUS MAKER.

A problem which causes some little expense and perplexity is that of the disposal of prunings and clippings of orchard and vineyard. For handling vineyard prunings a burner on runners has been used, but it has been objected to by very many. Of course the ideal way would be to return all the elements to the soil instead of going to the expense of hauling the prunings out of the orchard and burning on the roadside or where absolute loss is the result. Many growers have had a theory that if the prunings could be returned bodily to the soil in such a form that they would in time decay, it would help to restore its fertility. Now it appears that a machine has been invented to perform this service and is being manufactured by the Arnott Company of Los Angeles.

This machine is mounted on trucks, together with a small gasoline engine which propels a series of cutters which reduce the brush and prunings to such a size that as they are cast upon the ground and plowed under, they soon decay. Of course it is presumed that the wood which is large enough for fuel has been cut from the brush, but we have seen prunings an inch and a half in diameter cut up readily into small bits by this machine. We do not know if any definite figures are at hand, but it looks to us as if this machine would reduce prunings to this small size and dispose of them at a cost but little, if any, greater, than that of hauling out and wasting. If such is the case we believe the machine will be of great value. Those who are interested may secure additional information by writing to the Arnott Co., 112-118 South Los Angeles St., Los Angeles.

### FEIJOA SELLOWIANA.

We are informed that Coolidge's Flower and Plant House, 388 East Colorado St., Pasadena, has several thousand fine plants of the feijoa sellowiana. This plant has caused much interest among readers of the Cultivator since the reprint of the recent article written by Mr. Collidge for the Pacific Garden. Anyone wishing these plants should write to Mr. Coolidge.

### GRAIN SMUTS.

A dangerous parasite of many of the cereal plants is the fungus that produces in the grain or head what is known as smut. There are several well-known kinds of smut, each of which is caused by a distinct species of the fungus.

The greatest loss from smuts in this country is from the stinking smut of wheat and the loose smut of oats. A considerable loss is also due to the loose smuts of barley and wheat, which are more difficult to control and prevent They are widely distributed, and though they occur usually in small quantities the damage in the aggregate is large. They often are entirely unnoticed on account of their earliness and the absence of any conspicuous sign of them at harvest time.

The stinking smut of wheat transforms only the kernels into smut balls which do not break until the wheat is thrashed and often remain intact in the thrashed grain. The loose smuts of barley, on the other hand, early discharge their spores, which are blown off by the wind as soon as the smutted head comes out of the leaf sheath; they infect the plant in the flowering stage and enter the embryo inside the ovary before the latter ripens into seed. An infected seed develops a smutted plant the following year.

The most successful method thus far found for preventing these smuts is a hotwater treatment of the seed. This treatment is described in Bureau of Plant Industry Bulletin 152, entitled "The Loose Smuts of Barley and Wheat," recently issued by the U. S. Department of Agriculture. The bulletin is a report of recent researches into the life histories of these smuts and the determination of methods for their prevention, and is intended for seed growers and scientific farmers.

There are 3000 hop pickers busy near Healdsburg, Sonoma county.

# Your Eastern Trip

90 H. P. "Western" Pumping Water for Western Water & Power Co., Glendora, Cal.

# A Vast Difference

exists between "good enough" and "the best." There are any number of gas engines which are "good enough" for many purposes and people, but only "the best" should be considered for any high class proposition.

The **WESTERN** is the **best** gas engine built on the Pacific Coast, and while the first cost is of course more than that of the very cheap engines, yet it is no more than that of any standard engine, and this necessary difference in price is soon liquidated by the greatly lessened cost of fuel and repairs, after which your engine is a paying investment and a constant source of satisfaction to you.

The **WESTERN** saves 25% in fuel cost over other makes, being able—by reason of its special patented features—to develop a horse power hour with the least amount of the cheapest fuel.

With the Nix-Frost Crude Oil Gas Producer (Patented) a gallon of **Crude Oil** has the same power value as a gallon of Distillate. Ask us about it.

## The Tee Irrigating Valve

Simple in design and construction, costs less and will last longer than any other on the market.

The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities.

There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.

A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.

Address **George C. Roeding, Fresno, California**

# Why Newcomers are Dissatisfied with California

## A Few Observations by Bee Josephine O'Mealey, of Anderson, who is Not a Tenderfoot, of the Occasional Disappointments of the Tenderfoot who Engages in Agricultural Pursuits in California

TO begin with, not all are: a large per cent of the thousands who flock to the state every year would not "go back East," i. e., from Colorado eastward, to reside anywhere but in jail, and not willingly there. But the fact remains that there is still a large army of "knockers."

**First that Large Class of People who Always wish Themselves Where They are Not.**

That mistaken class, who imagine they can claim that superiority of birth, breeding and education, which fate has denied them, by the very tiresome habit of criticising everything with which they are brought in contact. You remember the cousin for whom Josiah Allen's wife bought the shawl—"black and white, even check, two and two. Two threads of black and two threads of white for I counted them. She took it, looked kinder disappointed and said, 'I'd a liked it a heap better if the black was where the white is' an' the white where the black is,' an' there it was even check."

It is not unusual to find people who have lived in twenty states, and, we may be sure growled endlessly in all of them, here at last at the outer wall of the United States sighing for the things they despised, and seeing no merit in the good things surrounding them. For them there is no cure, they were born so, and we can only wish them a happier disposition in their next reincarnation.

**Second, The Absurdly Over Drawn and Absolutely Criminal Statements Made by Some Real Estate and Immigration Agents.**

Words are curious things; a statement may be absolutely true, and yet give a wholly false impression, e. g.: In a well written and beautifully illustrated brochure setting forth the advantages of a certain section, occurs this sentence. "A cannery was established by the inhabitants some years ago." Which is very true—but it is also true that the cannery project broke up in a row, or something very like it, during the first season, and is, after several years, still indebted to most of the members who are fairly certain that they will always have something coming to them.

Looking over some old letters which came to me before my immigation to the State, I find the statement: "The grass is dry and brown during July and August, save for a few feet each side of the irrigating ditches..

Three summers have shown me conclusively that the grass is dry and brown, not only during those two months, but also the two months before and the two months following as well.

Special stress has been laid on the great healthfulness of this State, the absolute freedom from sunstroke, summer complaint, throat and lung trouble and those other unpleasant ailments which relieve the monotony of the year in the majority of Eastern homes, but the stranger is not told that there is something here which keeps one from being too sure of perpetual existence, and that is malaria. A stranger came to our place the other day who has just purchased a home near us. After expressing his great satisfaction with the prospects he added—"And then for another thing, they tell me there is Malaria in some parts of the state, but none was ever known here,"—and at the very time there were not a half dozen families in the Valley entirely free from it. Some people never have it, and some become immune to it, but every family has enough experience with it to spoil ready-made theories.

The unadorned truth about California is good enough for any reasonable being, but when all these glowing unrealities are held up so persistently before the home-seeker, he feels "jobbed" and "done" and consequently too grouchy to appreciate the good things he actually finds. Much of the printed matter which is disseminated is postively criminal in its half-truths and misleading statments, and I firmly believe the injudicious use of coloring matter in the pictures painted of this state the most potent cause of dissatisfaction.

**Third, Inability to Comprehend Conditions and Unwillingness to Adapt to New Conditions and Surroundings.**

The farmer from east of the Rockies must begin by unlearning the wisdom of his fathers. He must grasp the fact that a ditch is to carry water onto the land; not drain it off; that the market demands a rigid survival of the fittest, and that the fruit tree overloaded to the limit, and beyond, supported by props and stays and braces —instead of being an object of which to be proud —is, rather an evidence of ignorance, indolence or slovenliness. He must learn that the green fruit picked off in thinning is not wasted, but saved.

Leveling the Land in Imperial Valley.

The stranger comes to this golden land full of high hopes and aspirations for a speedy fortune, but with no knowledge whatever to assist him; he does not understand that those wet depressions which at home he would run a string of tile through and convert into the choicest part of the farm, are "hog-wallows" and if they have any value it has not yet been learned.

He does not realize that the warm, sunny, Southern slopes which the fruit-grower of the lake region prizes so highly because of their ability to grow bountiful crops of choice early fruit, will burn the life out of the trees and vines, and demand more and yet more water to sustain feeble existence.

The grain belt farmer plows and sows the seed; and thus ends his duties and responsibilities until time to harvest, and he does not readily grasp the fact that the California fruit rancher can work every day of the year, and finds something every day which needs to be done immediately.

The work is not hard. The fruit-rancher who complains of being over-worked, should change labor for one year with the general farmer of the Middle East, but before he does, he should have an iron-clad agreement about changing back again at the end of the year.

But while it is not laborious work, it is a ceaseless choring around, the trifles which go to make up the perfection so few of us attain.

The stranger cannot realize readily the great variation in a few miles. From Detroit to Cincinnati is 272 miles and the only crop difference is that of a few days in maturity: Illinois will produce the same crops as Massachusetts, the only difference being in the greater depth and fertility of the newer soil, but here in our own Shasta County may be found oranges and lemons and dates growing luxuriantly and only a very few miles away, eternal snow.

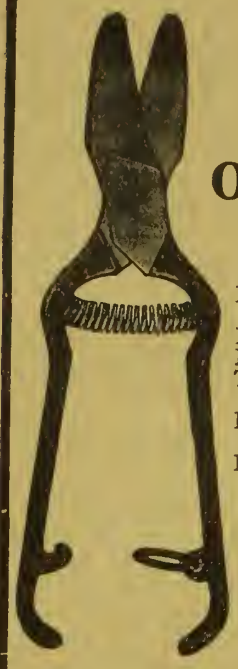
I have yet to see a home-grown cabbage produced in this particular valley large as a pint bowl, yet only a few miles away are grown 50 pound heads which would make a Wisconsin kraut-maker sit up and take notice. We have used every effort and device known to us to make onions grow large enough to smell, and have failed to get anything except microscopic subjects, but only five miles away they grow large and fragrant. The boundary between Anderson Valley and Happy Valley is nothing more tangible than a blazed tree, yet the former is famous for the quantity and quality of its prunes, but our prune orchard is more valuable as a wood pile than it ever was as a fruit producer.

**Fourth, The Society.**

All imaginable objections are urged on this score; one woman said to me emphatically, "I don't like California, there is no Sunday and the ladies swear," and it was useless to assure her the calendars were the same here as elsewhere, and good breeding does not change with climate.

Another person is seeking a location "where the people are not so perniciously pious." A letter received last week says, "the trouble is, California is a Godless country." A caller said a few days ago: "If some of these churches were dynamited, and the Pharisees who run them strung up, California could be made a fine place to live." So you see "one man's meat and another's poison." Side by side they exist and what pleases one human being is a thorn in the flesh of another.

California is, has been, and will be, a meeting place of cranks and faddists, but the cranks are the ones who make things go around, and you remember what the old Quakeress said to her neighbor: "All the world is queer but thee and me,—and sometimes of late I have thought thee was getting just a mite peculiar."



# WISS
## ORANGE CLIPPERS
### Will Not Bruise the Fruit

Indorsed by the United States Government Experts and by the leading citrus growers.
Recognized as the most practical clipper.
Made of the very finest material by expert workmen.
The blades are perfectly tempered and specially curved.
Handles are correctly shaped and will not tire the hand.
Every pair absolutely guaranteed.

# Citrus and Sub-Tropical Fruits

### SELECTING AND BREEDING BACTERIA.

REGARDING production of bacteria compound for inoculating seed of legumes or soil in which they are to be planted, we quote the following from an article by an eastern writer:

When we realize that man can raise plants many of which could be placed on the head of a pin, and that if we examine a bit of soil from the garden under the microscope, we find hundreds of different kinds so similar in general appearance as to deceive the eye of anyone unless accustomed by long training and observation to observe the minute differences, we appreciate the difficulty of the task of

COLONIES OF BACTERIA ON SOY BEAN ROOTS

discovering the characteristics and use of each kind. Were it not for the fact that men have worked from the other end of the problem, by having their attention called to certain peculiar effects in plants not easily explained and in looking for the cause made the discovery that these effects were caused by bacteria, the whole subject would probably be unknown to the word today. Knowing then that the colonies of the nitrogen-gathering bacteria grow on the roots of certain plants, the next problem was to find out what they lived on and why nature placed them on the plant roots.

The discovery that these little plants lived on nitrogen which they got from the air, and that they in turn gave off nitrates which the larger plants could take up, and which they must have in order to live, explained fully why they were there. Realizing their importance, scientists said, "Why, if we can only discover the way to feed and raise these nitrogen-gathering bacteria by artificial means, and then supply them to the farmer to use on his plants, instead of trusting to the haphazard chance that they might be in the soil he wished to plant, we will have something that would in a large measure do away with expensive fertilizers and be of incalculable benefit to the farmer."

Knowing that bacteria needed nitrogen to live on, some German scientists prepared a food containing nitrogen in the form of a nitrate, placed the bacteria in this material and with every good intention announced to the world the discovery of this wonderful method of fertilization. Have you ever kept bees? Whether you have or have not, you probably know how foolish it would be to place them in a hive full of honey and expect the bees to go and hunt for more. That is exactly what happened to the bacteria. Having an ample supply of nitrogen in a form much easier to obtain than the nitrogen in the air, they all became consumers instead of producers, and by the time they were placed on the larger plants, they had lost the power to do the work for which they were intended, and the agricultural world said, "Another Fake."

Undaunted by failure, other scientists discovered that the bacteria could be dried in cotton, kept for a long period of time in a dormant state, and then by placing them in a liquid containing nutrients, bring them to an active condition, ready to use on the plants, but although in occasional cases the bacteria survived, the farmers were in a majority of cases disappointed, and said. "Still Another Fake."

Dr. Earp-Thomas held the theory that to keep the bacteria alive, they should be placed in a food which did not contain nitrogen but did contain the other foods which they obtain

BACTERIA MADE THIS DIFFERENCE

when growing naturally on the roots of legumes, such as peas, beans, clover, etc. Many years of study and experimental work followed, with heart-breaking disappointments, but were finally crowned with complete success.

As with every great invention, what often seems to be a final discovery proves only to be the stepping stone for greater achievement, so in this case the discovery of the means of raising and shipping the bacteria lead to the discovery that some bacteria seemed to be much more active than others. The problem of selecting the most active specimens to breed from seemed almost insurmountable, as the only way to prove their activity is to watch their growth on the roots of a plant, and it would be manifestly impossible to keep plants growing in earth and pull them up every day to examine the roots. The discovery of

a transparent jelly in which the legume plants would grow when treated with the bacteria made what had seemed at first impossible entirely feasible.

Securing specimens of bacteria from plants growing in the open, they are placed on the seeds of the same kind of plant on the jelly in a tube, and in a short time the seed germinates and roots in the jelly. Now what happens? The bacteria have also been rapidly increasing in numbers, and as the plant roots grow, the most active, or, in other words, the ones with the greatest ability to enter the roots and to take nitrogen from the air, form the first colony or nodule on the roots of the plant.

Specimens are secured from this colony, and another seed is treated and again planted in another tube of jelly.

Now, by repeating this performance a sufficient number of times, you can

BREEDING BACTERIA

see that specimens of great value are secured. All this work is greatly handicapped by the danger of contamination from any one of thousands of kinds of bacteria that fill the air, and the greatest care has to be taken to prevent any of these from getting in and spoiling the work of many months.

## OLIVES.

I watch with interest every new development of science as we pass on in the grand panorama—human, animal, and vegetable life. As the season for caring for olives is near at hand, I wish to say to all whom it may concern that there is a better way of curing olives than the one now in vogue throughout the country. It is this: let the olives become perfectly ripe on the trees, then pick them carefully and dry them thoroughly in the sun or otherwise as you would prunes. The natural bitter of the olives to which some object, evaporates almost entirely during the process of drying and the natural richness and flavor of the fruit are both left in the fruit instead of being wasted in the slow process of curing. Prepared in this way, I would rather have one pint of olives than a gallon put up in the ordinary way, and those who have tried them agree with me.

To prepare them for table use, put as many as you wish to serve for a few times, in a fruit jar and cover with tepid water for a few minutes. Then pour off the water, leaving about a half inch in the bottom of the jar. Screw on the top so that the moisture will not escape. In a

BACTERIA MADE A DIFFERENCE OF 200 PER CENT IN THIS CROP OF SOY BEANS

few hours, or next day, they will be ready to serve on the table, and if the weather be not very warm, they will keep for several days.

I hope that some of your readers will try this mode of curing one of our best fruits. A friend of mine told me of the process, and gave me some of the olives. "We do not all know it all yet." The taste of the American people needs cultivation in many things, including the use and preservation of the olive.—Mrs. Carrie Williams, San Diego.

The plan of drying olives has been treated of in the Cultivator before, but the moistening to make them more palatable we believe has not been touched upon and it may prove a valuable suggestion.

## JUDGES ARE NAMED.

Prof. B. C. Buffum of the Wyoming Plant & Seed Breeding Co., Worland Wyo.; Prof. Hans Mendelssohn of the Billings Sugar Co., and Rev. J. G. Clark of Fromberg, Montana, noted as a horticulturist, have been selected to act as judges of the International Dry Farming Exposition which will be held at Billings, Montana, October 25-29, in connection with the Fourth Dry Farming Congress, October 26-28.

# Deciduous Fruit Culture

### THE ROUND-HEADED APPLE BORER.

YOUNG apple trees are often attacked at the base and seriously injured by borers. Even large trees are attacked, but do not become devitalized and show the effects of the work of the borer like the younger and smaller trees. Especially if the young orchard be isolated and surrounded by woodland is the attack liable to be severe.

Two kinds of borers are responsible for this kind of injury to trees, the roundheaded borer, belonging to the family Cerambycidae, and the flatheaded borer, which belongs to the family Buprestidae. The former is much more common and is the chief species attacking fruit trees. Neither species is confined to orchard trees, but lives in various native trees of the fields and woodlands, the roundheaded borer being especially fond of the wild thorn, mountain ash, shad bush and chokeberry, and the flatheaded species attacking many of the larger shade and forest trees.

The round-headed apple borer is found throughout the United States and Canada, at least east of the Rocky Mountains. The adult is a long horned beetle about three-fourths of an inch long, dark grey or brownish, with two straight white stripes or bands on the back running lengthwise of the body. These bands are not quite parallel, but join on the head and are farthest apart at the base of the wing covers, coming near together again at the apex. The antennae, legs and front of the head are white. The antennae are long and slender, as is characteristic with this family of beetles.

The eggs are yellow or pale brown, three times as long as broad and three times as broad as thick, and about one-eighth of an inch long. They are laid in incisions in the bark made by the ovipositor of the adult female, the eggs being placed lengthwise the trunk. The adults appear in June, July and August; the eggs are laid during these three months. The young borer tunnels just under the bark, working downward as far as possible before winter. Though inactive during the cold weather, it again begins operations in the spring, and burrows in the sapwood throughout the season, becoming about half-grown by the second winter. As it increases in size it does more and more damage to the tree because it is more voracious and active and makes larger tunnels through the wood. The next summer, when about three-fourths grown, it tunnels into the solid wood of the tree, and as it becomes full-grown works its way outward to the bark, making a circular hole. Remaining in the burrow unchanged through the winter, the larva transforms to a pupa in the spring and the beetle appears during the summer. About three years are therefore required for the complete transformations of this insect. Where several larvae are at work in the same tree they often girdle and kill it. The larva is white, with brown head and black jaws, and is about one inch long when full-grown. Usually the burrows are partially filled with particles of wood or castings from the excavations, and the pupating chamber is made of this material. Some of the castings are crowded or thrown out of the burrow, and form the principal evidence of the presence of the insect.

Many remedies have been tried but most orchardists prefer to watch their trees and dig out the borers with a knife when found. Sometimes carbon bisulphide can be injected into the burrow from an oil can and the opening stopped with clay, soap or wax, and the borer inside will be killed. External washes and other applications are of somewhat doubtful value, and the painting of the trunks is liable to cause great injury to the trees. Covering the base of the trunk with arsenate of lead may be of some value in keeping out borers, but this has not yet been thoroughly tested. It will adhere for a long time.—The Apple.

### CONTROLLING BLACK-ROT OF GRAPES.

In the eastern half of the United States black-rot has proven a serious drawback to grape culture. Humidity is favorable to this disease. More than twenty years ago spraying was introduced as a means of combating this and other fungous diseases of vines and fruit trees, and Bordeaux mixture has been the standard fungicide from the first.

As, during recent years, a good deal of discouragement among commercial grape growers has resulted from the spread of black-rot and their failure to control it satisfactorily, the United States Department of Agriculture about three years ago began a series of experiments to demonstrate the best methods of combating this disease. These experiments have been conducted in Pennsylvania, New Jersey, New York, and Michigan, and have extended over three seasons. The Department has just published a report on these experiments. (Bul. 155, Bureau of Plant Industry).

Several different fungicides were tried, but none was found to be as satisfactory as Bordeaux mixture. It was demonstrated, however, that a 4-3-50 mixture (4 pounds of bluestone, 3 pounds of lime, and 50 gallons of water) gives fully as good results as stronger mixtures. It was found to be unwise to use more lime than is absolutely necessary, as, when used to excess, it tends to hinder the action of the copper sulphate. It was also found that five sprayings will usually produce as good results as a greater number.

Among other mixtures tried, that known as the "neutral copper acetate" solution promises to be very satisfactory for the last application because of its nonstaining effect

On the whole the experiments have been quite successful. In 1907, where unsprayed grapes were a total loss, spraying reduced the loss to 28 per cent. The next season, when the rot was almost as bad on unsprayed vineyards, on the same sprayed plats the loss was reduced to less than 1 per cent. The good effect appears to be cumulative. The greatly increased spraying activity of growers, especially in Michigan, shows that these demonstrations have produced a good effect.

### CARBON BISULPHIDE.

This is a highly volatile liquid, the vapors of which are heavier than air, very penetrating and deadly to the small forms of animal life. The strong fumes are dangerous to man. It is used against rodents, insects affecting underground parts of plants, such as woolly aphis, ants, and for destroying insects in stored grain, fruits and vegetables. In the case of root insects a small quantity may be poured into a hole made in the soil near the plant. This opening should then be closed with a ball of moist earth. A wet sack spread on the spot helps. The liquid should not come in contact with the roots or stems of the plant. Poured in on the stems around the collar it proves fatal even to sassafras sprouts. But the fumes, if not too long continued or excessively strong, are not injurious to the roots. The treatment for cuts is similar. The fumes are deadly to borers, affecting the collar or base of the stem of young peach trees, and the writer has used it repeatedly for the peach borer with the greatest satisfaction. With a spade or hoe a shallow funnel-shaped cavity is made in the soil around the base of the stem, a teaspoonful of the liquid is then poured upon the soil in the cavity in two or three spots, or a circle six inches from the stem. The loose soil is then quickly heaped up around the stem and patted down with the back of the spade. In twenty to thirty minutes the borers will be dead. As many as nine dead borers have been taken from a single stem in this length of time after treatment. No scraping of the trunk or other preparation is necessary. In very loose soil or for larger trees, double the amount of liquid should be used. This work should be done in early spring or fall. When the tree is free from borers further infestation should be guarded against by wrapping the base of the trunks with resined or oiled paper, tobacco leaves, etc., extending below the surface of the soil and some inches above, tying the paper around the stem lightly at the top. Borer tanglefoot, sticky grafting wax, to which is added a little castor oil and applied warm (castor oil and rosin melted together make a sticky compound), and white lead paint mixed with pure linseed oil, but containing no turpentine, have also been used. Such measures have to be repeated from year to year and should be examined from time to time. Stored grain, seeds and other products, fruits and vegetables, may be freed from insect pests by the use of this material. One pound of carbon bisulphide is sufficient for a thousand cubic feet, provided the bins or containers are tight. When a chamber is used for fumigation, care must be taken to have it tight around the sides and floors. The liquid should be placed in the upper part of the compartment. The fumigation should not be continued as a rule, for more than 24 hours, after which an hour's free ventilation should be given. This is sufficient for all odor to disappear. The operator should remember constantly that the fumes are very inflammable and explosive. Hence no lamp or fire should be about while using this fumigant.—Ex.

Handle fruit as you would eggs.

### THE AGE OF TREES.

One of the marked changes now taking place in the field of practical horticulture is toward the use of young nursery trees in orchard planting. The time was, only a few years ago, when apple and pear trees were never planted at less than two years of age, while often they were taken from the nursery to the orchard at three, or even four or five years. This was the practice especially with pears. In recent years tree planters have come down pretty uniformly to the use of two-year-old trees of pear and apple. But there has been manifest for several years a distinct tendency to take even younger trees. Especially in the southern and western states, one-year-old trees have been frequently planted. And such plantings have been most common at the hands of large operators, in which circumstances the practice has been particularly significant. Hundreds of thousands of one-year-old apple trees have been planted out in the last five years.

Pear trees are also going out at an earlier age. In the south and west considerable quantities of Kieffer and Garber are planted; these varieties on account of their very strong growth in the nursery, are particularly adapted to planting at one year. But even such sorts as Bartlett and Seckel are now frequently planted at one year old, and this practice is being adopted to some extent in the northeastern states. Peach trees used occasionally to be planted at two years old, but are now almost universally set at one year. Still in the use of "June buds," tree planters are setting out many thousands of peach trees at an age considerably less than one year. A year or two ago when the frenzy for planting Elbertas was at its height, many thousands of dormant buds were planted in orchards. These trees are of an age represented only by zero.

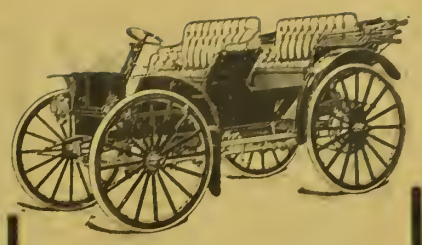
Nurserymen tell us that the present demand for one-year trees for next spring's planting is unusually strong. This change of demand is clearly reflected in the curious fact that all large nurserymen are charging exactly the same prices for one-year-old trees as for two-year olds. As it costs from 20 to 35 per cent. more to produce the two-year-old tree, such a state of affairs requires some special explanation. There are substantial advantages in planting the younger trees. They show a smaller percentage of loss. They are easier to handle. They form much better heads, especially under modern systems of low heading and close pruning. We may fairly expect to see the fashion go forward still and one-year-old trees become more and more common. On the whole, this tendency represents an improvement, or a series of small improvements, in orchard practice.—The Apple.

---

The prominent fruit growers of Ventura county held a meeting last week and determined to perfect an association of the orchardists for the protection and advancement of the industry. A committee consisting of Messrs. C. C. Teague, F. E. Barnard, E. S. Thacher, G. N. King and Thos. Bell was appointed to arrange details of the organization

---

The Department of Agriculture has offered to supervise the building of a four mile road from Chico to the plant introduction gardens, providing the county supplies the material and labor.



# Why Buy the International Auto?

**Because** It saves money in operating expense.

**Because** It avoids 90% of the ordinary automobile troubles with pneumatic tires—no punctures, no blowouts.

**Because** Air cooling does away with a cumbrous water cooling system, and obviates leaking radiators.

**Because** The engine is built for long service and to eliminate repairs.

**Because** Of the many other reasons that we want to tell you of in detail.

# Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

By Mrs. M. E. Sherman.

## MILK

THE Los Angeles Ordinance allows 20,000 as the bacterial count per cubic centimetre, while San Francisco limits the number to 10,000. The difference in climate makes it about even, for the cool air in San Francisco holds the milk at regular temperature. In the certified dairy, the cows must be turberculin-tested. In the original dairy in New Jersey the cows are tested twice a year. The milk from a cow that has garget or any ailment no matter how slight is not put into the certified milk can but goes into the ordinary bottled milk. This requires constant watchfulness on the part of the owner, for the milker will fail to note these trifles at times. The milk is not used within fourteen days of calving nor for six days after freshening The cows are carefully groomed and the udder and hind portion of the body moistened to prevent dust from falling into the milk. The milkers are required to put on clean white duck suits and the milk is drawn into covered pails. It is then run over a cooler and put into the bottles and iced. It must be delivered within eighteen hours. It was recommended that the milk should be run over a cooler but this is not in accord with later knowledge. The first few squirts of milk are often rejected and the remainder of the milk drawn in a different pail. This alone will greatly reduce the bacterial count.

### Prices.

At present in the larger cities the demand for certified milk is greater than the supply, for the producer does not feel that 15 cents a quart leaves as good a margin as ordinary milk. The greatest trouble and discouragement the dairyman meets in producing certified milk is from the readiness with which he is held up to public scorn if he fails to reach the mark. Publicity does not always tend to correct abuses but it does tend to keep the careful man out of the business. While I believe in exactness, still the same doctors that are harsh to the dairy man will tell of the successful operation performed when the patient dies—as though an operation was ever submitted to, except in hope of saving life. With the greatest care in the dairy sometimes the bacterial count will jump up, often by the careless handling of the sample in the laboratory. As long as the bacterial count includes all bacteria it is easy to raise the count by letting the milk grow warm, then the lactic acid bacteria will multiply very rapidly.

### Cost.

When Mrs. Judah years ago played the part of the nurse in Romeo and Juliet she used to turn and hold her hand out behind her back. The dairyman thinking of starting in the certified milk business asks at once if there is any back paying. Under the present plan there is none that is not a proper expense. The commission is usually the local medical society. The prices received are from one to three per cent more than for ordinary milk. This margin is too small to make many anxious to enter the field. The cost of veterinary inspection every two weeks is placed at ten dollars a month, tuberculin testing from 50 cents to $2.00 a head twice a year, bacterial test $2.00 a count twice a month, $1.25 a thousand for the certified labels, and $10.00 a month for chemist. Then in the milking string it requires an extra man to do the grooming for each hundred cows and $4.00 to $8.00 a month for washing the white duck suits for each milker. The milkers do not pay for this nor will they wash them. The Fairfield dairy of New Jersey milks 700 cows. The stables are specially built for making certified milk, and it is sold at an advance of 2 cents over the rest of the milk. No calves are raised and no butter made. Certified milk is then said to be milk made under the law and by specified ways of cleanliness. By law the fat in milk must not be below 3 per cent proteid and sugar 4 per cent as a minimun.

### Steamer Milk.

Now after certified milk became a market product human nature aspired still higher and then came steamer milk. This is even more carefully made. The cows are washed more thoroughly and groomed perfectly, then covered with a white duck sheet before any milk is drawn. The milkers wear in addition to their white duck suit white cotton gloves to absorb any moisture that may come on the hands. Cows are not put into the steamer milk string until they have been in milking six to eight weeks and then only until the third month of pregnancy. About a pint of the first milk from each teat is milked into a separate pail and set aside before the regular milk is drawn. The milk is carried directly from the milking barn to the ice room, bottled, sealed with a cap and paraffined, and then cooled thoroughly. The cooling in the jars protects it from further contamination. This milk keeps sweet for three weeks.—M. E. Sherman.

## THE USE OF CACTI TO SAVE STOCK.

After all that has been written concerning spineless cactus as a forage plant it would seem somewhat superfluous to call the attention of stockmen to the value of the cacti upon their ranges at this season of the year. But the mental step between spiny cacti and spineless ones seems to be a long one and one that few take readily.

In bulletin No. 74, Bureau of Plant Industry ("The Prickly Pear and Other Cacti as a Food for Stock," Dr. David Griffiths; U. S. Dept. Agri., Washington, D. C.) commencing on page 43 there is a long list of succinct statements relative to the possible uses of cacti, from which I quote the first, because of its present importance. "Prickly pear, although poor in nutritive quality, can be fed

to decided advantage under several conditions and for several purposes: (1) To save cattle during prolonged drought when other more nutritious food is scarce."

Now this statement applies to any kind of cactus that is big enough to furnish any quantity of forage, being especially true of the prickly pears and cane cacti. The truth of this statement is vouched for by many who have tried it.

This is by no means the only use for cacti, but at this season of the year, when all feed is dry and there is very little of it, when the water supply is poorest and stock, especially cattle on the range are dying in large numbers, it would seem to be a most important one.

This short article is written to call the attention of those stockmen, who have already availed themselves of the supply, and more especially those who are losing stock, to the fact that they probably have upon their ranges a forage which may be available to their stock by a little work.

Spineless cacti will not grow in the open range of New Mexico. In fact their thorns and spines together are one of the characters that make it possible for cacti of any kind to live on the open ranges. And even this defensive armor is insufficient to protect them from a number of enemies. But the spines do protect them from stock, and before they can be made into stock feed the spines must be destroyed.

Fortunately the spines burn readily, hence it is possible to singe them off without effecting the stems and so come at the forage.

Two ways of burning the spines have been shown to be practicable. One is to cut the stalks with a machete or a sharp spade and hold them in the blaze of a brush fire with a pitch fork The other is to singe them on the plants as they stand with a gasoline torch specially made for the work. This torch is made on the principle of an ordinary plumber's torch with a rather long pipe for the reservoir, and one that may be turned in different directions. Gasoline is a fuel and is used under pressure and mixed with air, so it is very essential that all joints be gas tight and be kept free of gasoline; otherwise serious explosions may occur.

The torch method is much the more rapid and less laborious. Experience has shown that it is well to have a good pressure in the tank and avoid using the torch in the wind as much as possible, since this materially increases the amount of singeing.

Considering the fact that we have a period of shortage of feed and water each year in the spring and early summer, and periodic recurrences of years that are drier than usual at that time, it would seem but a sensible thing for stockmen to encourage the growth of cacti upon those parts of their ranges where grass and better forage do not grow well; this to be done with the idea of preparing for the "lean year."

The easy way of planting cacti is to scatter the separate joints over the ground. They will take root without covering. The work may be done at any season of the year, though a larger per cent. of the joints will root during the rainy season. This statement applies to the lower and hotter southern end of the Territory.—E. O. Wooton, Bontanist New Mexico Exper. Sta.

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

## CHANGE IN REGISTRATION RULES.

At the recent annual meeting of the American Guernsey Breeders Club a change in the time allowed for entering animals was made. This is a very important step, a move which is believed to be of great advantage to both the register and the breeder.

If the birth report is filed the breeder can register at same rate applicable to registration under six months of age until the animal is three years old.

If the animal has not been registered before six months of age, or a birth report has not been filed, then the animal can only be registered upon the payment of a fee of $10 and getting the approval of the executive committee.

At first some might feel this was imposing hardships. Such is not the case. When fully understood the breeders have the advantage. Registration fees will in a way be lessened. By the filing of the birth report the breeder has three years instead of six months in which to register at the lesser rate.

It does put a heavier penalty on delayed registration. That was the intention. It is believed it is for the interests of the breeder as well as the register that animals should be recorded promptly. Much annoyance will be saved in the delay of certificates, because applications have had to be returned for correction or incomplete data, to say nothing of the complications usually arising from the sale of unregistered stock.

Breeders should register their calves before they are six months old.

Or, when they make record of calves dropped in their home records send a birth report to the office.

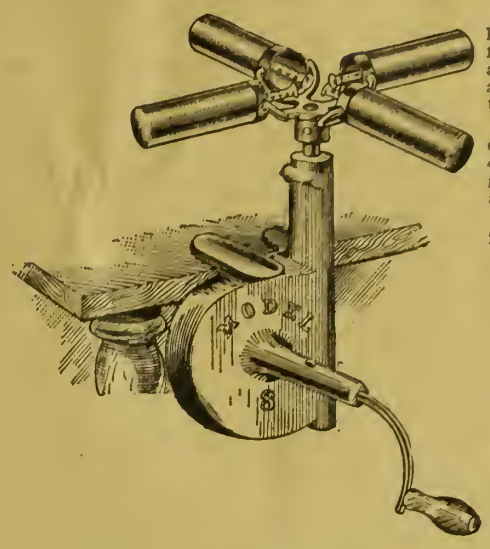
## SILVER TROPHY CUP.

A handsome Silver Loving Cup, beautifully engraved, embossed, burnished and gold lined, 14 inches in height and valued at $200 was received recently by Frank A. Welch, secretary of the Live Stock Committee at the A-Y-P Exposition, and placed on exhibition. The inscription upon the trophy is self-explaining, and reads as follows: "Presented by Joseph Benn and Sons Inc., Mohair Manufacturers, Greystone, Rhode Island, to the grower of the best Mohair in the competition at the Alaska - Yukon - Pacific Exposition, 1909."

The Nebraska Station has been experimenting with milking machines. It was found that most cows yield their milk as freely and fully when milked with a machine as when milked by hand, but with some individual cows the use of the machine is not entirely successful. Heifers accustomed to the machines from the first appear to do better than older cows which have been milked by hand.

At the recent meeting of the Delano Creamery Co. the following were elected officers: H. Hawley, president; Andrie Vieux, vice-president; H. Page Randall, secretary, and John J. Schlitz, treasurer.

# Improved Babcock Tester



Babcock Milk Tester, an extremely simple, light, compact and carefully designed apparatus, especially adapted for use in the dairy and also on account of its light weight to the Traveling Dairy Inspector.

The working parts are entirely enclosed in a handsome cast-iron case, and consist of but two cut gears, namely, bronze spiral gear and steel spindle with worm thread.

The Tester is fitted with swinging pockets and malleable iron head; it turns very easily without any vibration or jar and can be readily attached for operation to any table or bench. The bottles are perfectly horizontal when rotating.

# Small Fruits and Vegetables

### NON-POISONOUS SPRAYS.

THERE are many plants on which the gardener or fruit growers feels an instinctive reluctance to apply Paris green, London purple, arsenate of lead or any active mineral poison.

For use on orchard trees these are, without question, the least expensive, most effective and, with proper apparatus, most easily applied of all preparations employed against the biting insects, which include besides the leaf feeding caterpillars and beetles, the codling moth or rather its larvae, the apple worm, and several curculios. In most bulletins and articles by professional entomologists and horticulturists these same remedies are prescribed for the insect enemies of grapevines, berry bushes, vegetables and flowers.

In commercial orchards, berry fields and truck patches these poisons may be used with greater economy of materials and labor than any other yet discovered, but in the family garden any non-poisonous insecticide that will serve the purpose is much to be preferred. There is danger to children as well as to poultry and birds in drenching currant bushes, strawberry beds, lettuce and cabbage plants with arsenical sprays and, when treatment is necessary, the use of an innocuous substitute, if one exists, should be employed.

One of the most generally effective of these is Pyrethrum powder, or Persian insect powder. It is made from the dried and pulverized blossoms of a handsome plant of the chrysanthemum family and its production is one of the large industries of certain sections of California, where this Asiatic species best flourishes.

The aromatic oil upon which its toxic quality depends is, however, very volatile and the can or case in which it is shipped should be closed as quickly and as tightly as possible after the portion required for use is taken out. The lack of virtue, of which some users complain, is due to the fact that they purchased by the ounce or pound kept by the dealer in a loosely-covered cask.

It is safest to buy by the can or case tightly sealed. It can be applied as a dry powder and, when strong, diluted with an equal amount of flour. It is effective against both biting and sap-sucking insects, will kill all cabbage insects except the harlequin bug and is speedily fatal to every kind of aphis except the brown species that attacks the chrysanthemum, probably because the latter plant is so similar to the one from which the insecticide is manufactured that the insects are inured to its qualities.

Flies are killed by diffusing the dust through the room and closing the latter for a short time when the flies will be found upon the floor in a stupefied condition and may be swept up and burned. A smudge made of a pinch of two of the powder on coals or a hot shovel will speedily clear a room of mosquitoes.

Another widely valuable preparation, which for some reason is not perfectly understood, and an absolute specific against all species of sawfly larvae, is white hellebore. This is made from the powdered roots of Veratrum veride, a coarse weed of low meadows and swamp lands. It is one of the safest and most convenient remedies for use against the currant, strawberry and rose "slugs," as these larvae are called. It is also deadly to most smooth caterpillars.

It may be applied in the form of powder dust or through a thin muslin bag or with a powder bellows, and may be diluted with several times its bulk of flour. On rose bushes it is best made into a tea, steeping one ounce in a couple of quarts of hot water and, when cool, diluting with sufficient water to make 3 gallons and apply with a syringe or whiskbroom. The time to apply it is in the evening, whether powder or infusion is used, as the sunlight rapidly neutralizes its power and also because the insects against which it is effective are mostly night-feeders.

Tobacco has been discovered to be one of the useful of the practically non-poisonous insecticides. It can be adapted for this purpose in various ways.

For aphides and other root-destroying insects a simple mulch with the coarse stems and refuse placed around the trunks of infested fruit trees and other plants will in most cases not only cause the insects to disappear, but will supply an excellent fertilizing element to the soil. In the form of powder diffused by means of a dust sprayer or powder bellows, it will speedily rid trees and bushes of aphides and repel many of the small flies that cause galls and deformations on the leaves.

For use in the garden and greenhouse great dependence is now placed upon tobacco extract. This is prepared from the waste of the cigar and other factories, and contains a considerable per cent. of pure nicotine. One to three per cent. of this in either hot—not boiling—or cold water, is harmless and not disfiguring to the most delicate plants, while it either exterminates or repels their insect enemies. It is also largely employed against animal parasites on stock.

The green cabbage worm and many other pests of this vegetable can be killed by drenching the plants with the following preparation: One-fourth pound alum, one pound lime dissolved in one-half gallon of hot water. In applying use three fluid ounces (six tablespoonfuls) to ten quarts of water. Some of these substances, such as the white hellebore and tobacco extract,. possess genuinely poisonous qualities, but, in the proportions in which they are used as insecticides, they are harmless to the larger animals.—Ex.

### HORTICULTURAL NOTES.

Save the hard wood ashes for the strawberry plants and grape vines.

Do not prune new raspberry canes until early spring. Cut out the old canes now.

Raspberry vines that show signs of anthracnose should be dug up and burned if it is desired to save the others.

Hold plant disease and insects in check by going through the plum, cherry, peach and apricot orchard after harvest and picking up diseased and fallen fruit.

# The Ornamental Garden

## THE TOAD AS A FRIEND.

GREAT and benefical results are often accomplished through very humble agencies. Darwin has established the claim of the earthworm to the gratitude of the tiller of the soil, and modern science is revealing thousands of hitherto unseen and unknown agencies working in the interest of man. Science now comes forward to establish what a few have long maintained, viz, that the ugly and despised toad is a faithful and efficient servant of the farmer.

From the earliest times, the toad has been associated in the popular mind with a host of "vague and ludicrous fancies as to its venomous qualities, its medicinal virtues, or most commonly, the hidden toad stone of priceless value." To these venerable creations of the imagination have been added others equally absurd, such as "that touching toads will produce warts on the hands; that killing toads will produce bloody milk in cows; that a toad's breath will cause convulsions in children; that a toad in a newly dug well will insure a good and unfailing supply of water, or in a new-made cellar will bring prosperity to the household, etc." An investigation of the habits, food, and economics of the American toad dispels these fallacious ideas, and at the same time establishes the claim of the little animal to our consideration and appreciation.

The eggs of toads are nearly black in color and rapidly increase in size. In two weeks the young tadpoles are clearly outlined, and in three or four weeks the eggs hatch. The vegetable detritus of the pond bottoms and the slime and algae attached to sticks, plants, etc., seem to be the common food of the tadpole. Warm weather favors the growth of the tadpoles. At time of leaving the water they are exceedingly sensitive to heat, and secrete themselves under leaves, rubbish, stones, etc., during the day; but let a vigorous shower descend and the transformation is magical. The walks, roads, and gardens at once become peopled with myriads of these thirsty, leaping creatures, and their sudden appearance has led to the popular belief that they "rain down."

Many of them reach an age of at least 10 or 15 years. Experiments have been made which "show that it is possible for the toad to exist for a limited time without food, but throw a shadow of improbability upon the stories of those found in rocks, trees, etc."

When suddenly disturbed or roughly handled the toad ejects a colorless fluid from the anus and a milky liquid from the skin. This habit is probably the basis for the belief that the toad is venomous. The secretion of the skin glands is harmless when applied to the hands, but it evidently possesses acrid properties, since when toads are bitten by dogs or cats the latter usually have a copious flow of saliva, show signs of discomfort, and in many cases coming under the observation of the writer have manifested considerable distress.

The toad sheds its skin four or five times each year.

The toad can not endure high temperatures. It is a nocturnal animal, and ventures out during the day only when tempted by an abundance of food in its immediate vicinity or when the air is full of moisture. It eats only living insects, centipedes, etc.

The toad's tongue, its only organ for seizing food, is soft, extensile, attached in front but free behind, and is covered with a glutinous substance which adheres firmly to the food seized. So rapid is the motion of this weapon that a careful watch is necessary in order to see the animal feed. * * *

At night, soon after sundown, or even before on cool evenings, the toad emerges from its shelter and slowly hops about in search of food. Something of a regular beat is covered by these animals, whose sense of locality is quite strong.

The toad as a rule feeds continuously throughout the night, consuming in twenty-four hours an amount of food equal in bulk to about four times the stomach capacity.

A careful examination of the contents of the stomachs of a large number of toads showed that 98 per cent. of its food was animal matter—worms, insects, etc. "Eleven per cent. of the toad's food is composed of insects and spiders beneficial or indirectly helpful to man; 80 per cent. of insects and other animals directly injurious to cultivated crops or in other ways obnoxious to man." It is estimated that a single toad destroys in a year insects which, if they had lived, might have damaged crops to the extent of about $20.

To all agriculturists the toad renders conspicious service, but gardeners and greenhouse owners may make this animal of especial value. Every gardener should aim to keep a colony of toads among his growing crops and the practice of collecting and transferring them to the gardens is a commendable one. While the sense of localiy is strong in this batrachian and it will often return over considerable distances to its original haunts, yet it may be induced to remain in new quarters if there is a sufficient food supply.

The crow and various species of hawks and owls are the chief natural enemies of the toad, but as a common enemy of the toad the ubiquitous small boy plays a prominent part.

There have been excellent laws enacted to protect our insectivorous birds. Why should there not be as stringent legislation against the destruction of toads? If merit of service rendered to man be the standard by which legislation is determined, the toad presents a record which will compare favorably with that of any insectivorous bird. Public sentiment in a matter like this, however, exerts a stronger influence than legislation, and when the services of this animal are appreciated and the toad receives in our public schools recognition similar to that given to the birds, then we may expect to see a lessening of the wanton destruction of this humble servant of man.—The Apple.

## Lemon Freight Rates.

AN EDITORIAL prepared for last week's paper, which was forced out at the last moment, referred to the possibility of the railroad people demanding a part of the increased tariff on lemons by raising the freight rates. Rumor has been persistent since the passage of the bill in asserting that the railroads would do this. The Cultivator did not believe it and had in type an article saying:

The lemon industry has been in a serious situation for several years. An uplift has now been given and the mistake of such a step taken by the transportation companies which would discourage it is inconceivable The millions of dollars paid by the orange gtrowers for freight may not be equaled by by the lemon men, but the amount will be greatly increased over the present if the industry is encouraged

This article was headed, "The Goose That Lays," and the paper was not off the press before the railroad management announced their intention to sever the head of a producer of the golden eggs.

Regarding this raise Mr. F. Q. Story, Chairman of the Executive Committee of the Citrus League, says: "The railroads are exercising undue haste in trying to wrest from the growers the benefit of any portion of the tariff which the government awarded to them after careful investigation of the argument that the success of the lemon industry absolutely demanded the protection given by law."

Assuredly the railroad people have not been slow in demanding the benefits of the advanced tariff. This may profit them in the end, but we believe they have made a mistake which, in view of the enterprise shown by the big corporations in other lines, is to be wondered at. The same companies will put up thousands of dollars to conduct demonstration trains which bring in not a penny of direct returns, claiming—which is doubtless entirely true—that the companies wish only to encourage more intelligent farming that the farmers may bring greater tonnage to the railroads. Had the railroads deferred this action a year, or two or three years, it would have encouraged the industry and put it on its feet to the increased profit of the railroads.

The lemon men consider this an especial injustice because for years, excepting in occasional seasons of high prices, the railroads have received far more from the lemon industry of California than the lemon men themselves.

## Stand by the Reclamation Service.

LAST week's Cultivator contained an editorial on the reclamation service, referring particularly to the relations between Secretary Ballinger and Forester Pinchot. The editorial had been written some time before but held over for lack of space. It was barely in print when the press despatches announced President Taft had unqualifiedly sustained Secretary Ballinger. To say this decision was extremely disappointing to the people of the West who are anxious to see our great resources conserved for the people, is to put it mildly. There seems to be no spirit of criticism or of anger at President Taft for his action, but rather regret that his viewpoint did not permit him to sustain the reclamation service.

The Los Angeles Express says truly that the tone of President Taft's letter conveys the idea that: "If the technicalities of the law are such as to prevent the water-power trust and the timber-land grabbers from gobbling up the public domain, then conservation of the natural resources is a good thing. But if every step taken in conservation is not strictly within the law and buttressed by legal authority, then—well, then the gobblers must be permitted to gobble.

"Roosevelt would deal with these private grabbers of public property in any way that his unlegal brain could invent. His first thought would be how to preserve these valuable rights to the people.

"As between the Taft way and the Roosevelt way, however, it is merely a difference in mental attitudes. Each acts honestly and in the light as it is given him to see the light."

Secretary Ballinger's address at the Irrigation Congress was of such a tone that many cannot overcome the feeling that he is more friendly to the large interests than to the home maker.

## Texas Rice Day.

ON California Raisin Day, April 30th, appeal was made to the people of the United States to celebrate the day by making raisins the principal feature. It is said that amongst those who took up the suggestion most heartily were the Texas rice growers. They now come back at California and request of its people and all others the observance of September 30th as 'Texas Rice Day." The Southern Pacific Railway Co. has joined in the plan and has instructed all Sunset diners, Atlantic Coast steamers and Sunset eating houses to serve complimentary rice desserts on that day, combining with the rice some California fruit.

In consideration of the healthfulness of the food and the desirable dishes it makes, it will be fitting that California fruit growers enter into the spirit of the day and add rice to their bill of fare on September 30th.

## Advancement.

CALIFORNIA seems to be the horticultural training ground for workers for all sections of the world. Our horticultural activities are so conducted that the worth of our better posted workers seems to be recognized. A few years ago Mr. Alexander Craw was taken from the state quarantine office at San Francisco to take charge of the quarantine work of the horticultural department of the Hawaiian Islands. Since his death until a few weeks ago the office has remained vacant. At that time Mr. Edward M. Ehrhorn who had filled Mr. Craw's place at the port of San Francisco since his transfer to the islands, was tendered and has accepted the position formerly held by Mr. Craw in the Hawaiian Islands.

Mr. Ehrhorn has made a most efficient officer; he is a thorough entomologist, and a world authority on scale insects; and has safeguarded our state against the entrance of numerous pests which would have found admittance but for his watchful eye. He has an enviable reputation the state over as an officer, a gentleman, and a scientist, and he will take with him to his new home the best wishes of thousands of fruit growers and friends in this state.

## Farmers Club.

ONE of the live horticultural clubs of Southern California is the Claremont Horticultural Club, a report of whose last meeting in June was given in the Cultivator. While it is called the Claremont Club, it has extended its scope and usefulness until it concerns a large portion of at least Southern California. It holds monthly meetings excepting during mid-summer, its last meeting before and first after the vacation being in Ganesha Park, Pomona. This latter meeting will be held this year on Monday, September 27th and will be addressed by prominent men amongst whom are U. S. Senator Flint, Jas. Mills of Riverside, Judge A. F. Call of Corona, and C. C. Teague of Santa Paula. There will be forenoon and afternoon sessions with a picnic lunch at noontime. There will also be an automobile ride over a portion of the valley.

## Placer County Aroused.

STATE COMMISSIONER of Horticulture, Jeffrey, issued a call for a meeting of the fruit growers of Placer County to be held at Newcastle on Wednesday, September 29th, to consider means of controlling various fruit pests, and to secure the appointment by the board of supervisors of the county of an efficient horticultural commissioner under the new law, also to consider matters of general interest to fruit growers. The meeting seems to have widened in its scope, until now it is expected that fruit growers from many sections of the Sacramento Valley will be present. Some of the strongest men of the northern part of the state will be there to urge this appointment which will give an uplift to the fruit industry.

We do not know as to the former attitude of the board of supervisors, but assume that this action is made necessary by their indifference to the greatest industry of that productive section. It is to be regretted that "politics"—used in its lower sense—predominates to such an extent that men elected to important positions fail or refuse to recognize our greater industries.

Another question which may be discussed at this meeting, if there is time, is that of leasing orchards to Japanese contractors. This practice has brought about a serious situation in many sections of the state and its early discussion will prove beneficial.

## Apple Crop.

THE SEPTEMBER number of the Crop Reporter issued by the Department of Agriculture gives the average condition of the apple crop September 1st as 44.5 as against 46.3 last month and 52.1 on September 1st, 1908, and a yearly average up to September 1st of 55.5

This shows a material shortage of apples which Pacific Coast apple growers will benefit by, and we may say that Pacific Coast growers of all kinds of fruit will also benefit to a certain extent.

## More Picnics.

SAN FERNANDO fruit growers have formed the picnic habit and the Fruit Growers Association has issued a call for an all day meeting and picnic for Saturday, October 9th. The forenoon will be spent in visiting various orange and lemon groves, discussing methods of culture, pruning, etc., after which all will gather at the orange and lemon packing house at one o'clock for luncheon such as farmers' wives know how to prepare. The afternoon will be given up to discussions by prominent speakers from different parts of the state.

# Agricultural News Notes of the Pacific Coast

## Northern California

A grape festival will be held at Kentfield, Marin county, October 2nd.

The Yuba City packing house is now sending out large quantities of fresh figs.

Over $200,000 will be received by Mendocino county for its hop crop this season.

Buyers of cattle are picking up many bunches of cattle in the vicinity of Corning.

Sebastopol farmers recently held a meeting and organized a branch of the farmers union.

The officers of the new farmers union at Santa Rosa are J. T. Pepper, President and E. J. Ferguson, Secretary.

Early peaches are practically all cut and dried at Vina, Tehama county, and liberal cutting has been made of later varieties.

A cherry grower near Oroville has been exhibiting some September cherries raised at an elevation of 2750 feet back of that city.

One vineyardist at Gridley, Butte county, picked and sold 22 tons of Thompson Seedless grapes from three acres, netting $18 per ton.

The Armsby Preserving Co. Cannery at Yuba City closed for the season because of lack of drainage of surplus water from the cannery.

The Chamber of Commerce at Corning, Tehama county, has an exhibit of the fruits and products of that section in the Board of Trade rooms at San Francisco.

District No. 777 near Live Oak is in a serious condition because of a lack of proper drainage. Rights of way for a new drainage canal are under contemplation.

Wine grape growers at Gridley have refused to accept the five or six dollars a ton from the California Wine Association and are looking for other market for their grapes.

The restriction of the national forests and the uncertainty of securing summer range for stock have caused some sheep and cattle owners at Red Bluff, Tehama county, to retire from the business.

The smelter situation in Shasta county is becoming more and more serious and the Shasta Farmers Protective Association is holding many meetings at which greatest indignation is expressed.

The branch of the California Wine Association located at Woodland is not purchasing any grapes of the local growers, but depending entirely upon fruit shipped in from the northern part of the county.

Owners of orange trees at Marysville are finding that their trees which were defoliated a couple of years ago in order to clean up the white fly, are now full of young wood and bearing excellent crops.

The state horticultural commissioner has called a meeting of fruit shippers to be held at Placerville Wednesday, Sept. 29. It is called primarily for the fruit growers of Placer county, but delegates from other counties will attend.

## Central California

Salinas boasts of a 25 pound sugar beet.

Shipments of Malaga grapes have been returning prices which were not up to expectations.

The Mohave "Desert" is now producing some remarkably fine watermelons and cantaloupes.

Articles of incorporation of the Turlock Farmers Union have been filed with the County Clerk.

The farmers union at Fresno has inaugurated a movement to secure the 1910 National Union for that city.

The Spreckels sugar factory is now turning out about 3000 sacks of sugar daily. Its full capacity is 10,000 sacks.

A forest fire of great extent and damage visited the Great Basin section of the Santa Cruz mountains last week.

The grape juice factory at Turlock expects to put out about 150,000 gallons of juice as the product of this season's run.

A Turlock grape grower claims to be able to get more than five dollars per ton for his grapes by feeding them to hogs.

One feature at the Tulare Fair this week was a seven day butter fat contest in which seventeen registered cows were entered.

The Modesto creamery which started eight years ago on 125 pounds of butter per day, now has a daily output of 3,500 pounds.

Notwithstanding the immense losses by fires in this state last year, it is now predicted that this year's losses will be far greater.

A Japanese engineer investigating as to American irrigation methods visited the great Turlock-Modesto Irrigation System last week.

Percy Morgan of the California Wine Association asserts that the independents are responsible for the cut in price of wine grapes.

Watsonville has shipped nearly 400 cars of Newtowns and bellefleurs. So far this season an abundance of cars has been supplied by the railroads.

The chamber of commerce at Fresno has refused to furnish a site for an olive oil factory, maintaining that it is against the policy of giving bonuses.

Livestock raisers with ranches in Santa Clara and Santa Cruz counties have filed suit against the Southern Pacific railroad for sheep killed on the tracks.

Sweet potato growers of Turlock, Atwater, Merced, and other points, met recently at Merced for the purpose of forming a sweet potato pool and disposing of their crop at best prices. They refuse to sell for less than one dollar per hundred.

The Laton Co-operative Creamery Association held its annual meeting the last of August and Secretary G. A. Smith reported 6,934,981 pounds of butter for the year's work, which sold for $202,547. The average price for butter fat to the members was thirty cents.

## Southern California

About 500 cars of Valencias still remain to be shipped.

Orange county will produce about 50,000 sacks of balckeye beans.

Farmers of Imperial Valley will sow their grain earlier than usual this year.

San Diego county lemon growers are pleased at the lemon tariff which is giving them a small boom in land values.

Several threshing machines are busy with the lima bean crop of Ventura county.

Six separate and very serious fires occurred in the San Gabriel watershed during the past week.

Fruit growers of Bloomington, San Bernardino county, held a picnic at the orange packing house last Saturday.

A meeting was recently held at Thermal to consder the advisability of forming a county farmers union for Riverside county.

Ventura county sugar beet growers are testing a new beet topper which does excellent work more economically than the former method.

Redlands held one of its most interesting farmers institutes on the 15th and 16th, the discussions pertaining principally to citrus culture.

Orange county lima bean fields are producing much heavier than was anticipated and it is now estimated that the county will have over 250,000 sacks.

The first shipments of celery from Orange county were made by the Santa Ana Produce Co. on Sept. 16th. Celery is now bringing from $2.25 to $2.75 per crate.

Orange growers at Anaheim have decided to affiliate with the Semi-tropic Fruit Exchange and market fruit through it. Their association handles about 150 carloads.

The great pre-cooling plant being erected by the Santa Fe at San Bernardino will cost over one million dollars and is said to be one of the finest plants of the kind on the continent.

The announcements made by the railroad companies of an increase of fifteen cents per hundred in the freight tariff on lemons has created a storm of indignation in all lemon growing sections.

Articles of incorporation have been filed in Orange county for the Tustin Hills Citrus Ossociation. The directors elected are: J. M. Akins, B. H. Sharpless, A. J. Padgham, P. H. Covington and R. Brinsmead.

The first cotton crop of the Imperial Valley is estimated to run from a half to three-quarters of a bale per acre. This is said to be about the average production in regular cotton raising countries and not up to expectations for Imperial Valley.

The annual meeting of the stockholders of the Rialto Orange and Lemon Association was held on the 16th. The following directors for the coming year were elected: J. N. Knoblaugh, George Brua, R. E. Wilkinson, W. N. Glascock, W. F. Grow, M. C. Hodge, Floyd Gallihue.

## The Coast

Albany, Oregon, is to hold an apple show Oct. 27-29.

Clark county, Washington, reports filberts netting $675 per acre.

The new Union Stock Yards at Portland, Ore., opened on Sept. 15th.

Alamosa, Colo., has a single apple tree which yields 70 bushels of apples.

A Pullman wheat grower produced over 40 bushels an acre from 90 acres of grain.

Threshing machines near Coulee City, Wash., have practically finished the season's run.

Dry farm process have succeeded in vastly increasing the agricultural products of Colorado.

Some orchard lands in the neighborhood of Grand Junction, Colo., are held at $2,000 per acre.

Walla Walla, Washington, apple growers report their output of apples as less than that of 1908.

The combined harvester and thresher is taking the place of the header and binder in Washington.

The Coos County Fruit Growers Association will send a thousand boxes of Gravenstein apples to Hawaii.

Owing to unfavorable weather the cotton crop has dwindled in Texas to less than forty per cent of normal.

Prof. H. E. Van Deman will act as one of the judges at the National Apple Show to be held at Spokane Nov. 15-20.

Prune picking and drying began earlier than usual in the Portland, Oregon, section and is now in full swing.

A quarantine has been placed upon the hogs of the Yakima Valley until the cholera epidemic prevailing there is under control.

Sixty gorgeously painted Indians recently entered the huckleberry fields near Husum, Washington, to engage in huckleberry picking.

The members of the Senate Irrigation Committee were at Cheyenne, Wyo., last week and will later visit points in Washington and Oregon.

The poultry people of Eastern Washington will make the poultry department of the coming Inland Empire Fair at Spokane, a notable one.

Farmers in Yamhill county, Oregon, report the best yield of red clover seed this season that they have ever had and that the seed is of exceptionally good quality.

The sugar beet crop in the neighborhood of Holly, Colo., will aggregate over sixty thousand tons this year. The average price will be not far from five dollars per ton.

More than 200 pure bred animals have been entered by breeders of every section of the United States and Canada in the A-Y-P- stock show. This feature of the exposition begins next Saturday.

Prof. P. J. Iddings representing the Dry Farming Congress, will investigate farming conditions in Arizona. Prof. Iddings was formerly connected with the Colorado Agricultural College.

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

## LICE, MITES AND FILTHY HOUSES

By Mrs. Frank Metcalf.

THIS is not a savory subject, and one would think it worn threadbare, but too much cannot be said or done to subdue the one and eliminate the other. Dirty coops are very nearly always lousy, so keeping them clean is a great help towards keeping the lice and mites in check, but is not all-sufficient. Some strong vermin killer must be used thoroughly and often, the best and most successful poultry raisers spraying every two weeks, year around, with something strong enough to kill vermin and at the same time disinfect the building. Many preparations are on the market for this purpose and a glance over the advertising columns will convince you that there are plenty of "dopes" warranted to do the work for which they are intended, if used rightly.

Stinginess in this matter is "saving at the spigot, and wasting at the bung-hole," really and truly. And in spraying, one must remember that the whole place must be drenched, top, bottom and sides, and between joints, or the work is ineffective. To go into a henhouse and carelessly squirt a few drops here and there won't do. Drench the whole place inside and out, then take a cloth wet in the spraying material and wipe off the under sides of every roost and nest box, and I do think you will be rewarded by the find of thousands of unsuspected mites, piled up in the most out of the way corners imaginable. Why, I found a whole city full living in a crack in a brick under the out door nest in one yard. Big fat red mites, that showed they were enjoying life in the most mite-like manner. They did not enjoy the bath of distillate I gave them and not one lived to perpetuate his kind.

At this time of year chickens are also likely to get wormy, as they pick up much fruit, and various kinds of germs and eggs may be lodged thereon. It is well to give them an occastional dose of sulphur, say a teaspoonful in each quart of mash, as this won't do any hurt even if no worms be present. Salt should also be given occasionally, as hens need a certain amount of salt as well as other stock, and salt in a good vermifuge in itself.

If sulphur is liberally sprinkled in the dust bath, it helps in ridding the fowls of body lice, and is excellent to rub through the feathers once in a while anyway. Being so much cheaper than buhach, it can be used with greater freedom, and we need to save every cent we can to make profits in the poultry yard. An old Dutch woman who was very successful with her fowls, used to regularly take a mixture, composed of road-dust 1 bushel, sulphur 1 pound, wood ashes 1 quart, and slacked lime 1 pound, and give every fowl on the place a bath once a month, willy nilly. Setting hens had to come off the nest, hens with chicks also had to be treated and her hens always "paid."

## POULTRY QUERIES.

**Size of Pen.**

We have a chicken pen 70x70 feet, containing six large orange trees. Adjoining it is a corral 40 by 41 feet, chicken tight. With good houses and proper care how many hens can profitably be kept in the above pen which has access to the corral?—A subscriber, Fillmore.

It all depends upon the care how many hens can be profitably kept anywhere and in a small space the care is doubled, as the premises must be kept reasonably clean or disease will decimate the flocks.

Your 70x70 space contains 4900 square feet, and allowing ten square feet for each hen, 400 hens could be kept on this ground by constant care, but half the number would probably prove far more profitable.

As you have six orange trees, a good way would be to divide your space into six pens, each one containing an orange tree for shade, and keep 25 in each flock at the start. Fifteen would suit me better, but I like to give them more room than most people do, although the experience at most Experiment Sta. demonstrates the fact that 15 is the proper number to keep in a flock for the best results. It is not always how many, but how well a flock may be kept that pays, at least in the end. Unless you are well used to the care of chickens, I should advise a smaller number until increased experience warrants the maximum number that can be taken care of.

With fifteen in a flock, and with six flocks, you would have 90 hens. Each hen would have plenty of elbow room, although, of course your houses will take up some room and I believe that fifteen comfortable hens will pay better returns than 50 crowded ones would do, but remember, my opinion is not infallible.

**Roup.**

Will you kindly advise me what remedy I should give my chickens? First they had the roup, and then one eye began to swell and soon the other one was swollen also.—A subscriber, Petaluma.

If I should advise the ax, I should give my inmost conviction as the very best possible remedy for your sick birds, and a deep burial of all carcasses where they will never be dug up by other stock, or, better still, burn them. This may seem a harsh measure, but of what use are those cured birds anyway? They will never again be fit for breeders, as their offspring will inherit the tendency to the disease, and the first cold wind that blows upon them, they will develop the same symptoms, so the best way is to separate all the ailing birds and kill them off, then clean and disinfect the coops and plow the ground deeply and grow some crop on it before using it for fowls again. When roup once gains a foothold in a flock, profits disappear, and the cheapest way is to stamp it out thoroughly by killing off all diseased birds and removing the well ones to fresh runs and houses if it is possible to do so. I have experimented with different remedies and have cured birds which were, apparently in the last stages of roup, eyes almost bursting, in some cases one eye entirely gone. Have used the solution of permanganate of

potash and cured the worst cases, but the hens never laid enough eggs to pay for their feed, and I never cared to eat their carcasses, after knowing how sick they had been, never would sell what I couldn't eat myself, so of what avail was all my painstaking when the ax would have settled the matter so much more speedily and cheaply and with so much less suffering for the patient? If you want to try for yourself, get 5 cents worth permanganate of potash, and dissolve in three pints of warm water. Immerse the affected head in it, eyes and all until the bird strangles, which draws it into the throat and head. Repeat night and morning until cured. There are good cures advertised in our columns right along, already prepared for use, but nothing like the ax.

### Ptomaines.

Will rotten potatoes cause limber neck or any other disease in poultry? Lost a four months old turkey last week, evidently from what was limber neck, don't think there was any possibility of it having secured any putrid meat, but do know the flock got some rotten potatoes. Have seen it stated that limber neck was not caused by the maggots in putrid meat, but by ptomaine poison.—B. E. S., Pomona.

I think the maggots in putrid meat do cause ptomaine poison, and that limber neck is a symptom of ptomaine poison. I should suppose that the maggots themselves would be fresh meat enough, but the fowls can scarcely eat them without also getting a portion of the surrounding tainted meat along with them. I should not consider rotten potatoes a safe diet for chicks or turkeys, as the decaying matter would set up an intestinal irritation very similar to ptomaine poisoning if any quantity was eaten.

Sometimes an egg that contains a dead chick is carelessly thrown away, and a whole colony of maggots evolve, and chicks or turkeys are sure to find just such things, and then, look out. A vigilant watch must be kept all the time if we would protect our stock from danger and ourselves from consequent loss.

### Fireless Brooders.

Are fireless brooders a success and are they as good as lamp brooders? Can the heat be regulated in them, and can the chicks be kept warm in them in cold weather?—R. B., Hanford.

Chicks can certainly be kept warm in the fireless brooders while they are in them, in any weather, but of course, when out of the brooders, there is no heat in the air in the house or shed in which the hover is kept, so for cold weather, some system of taking the chill off the air must be provided during the daytime. So, for winter raising of chicks, perhaps lamp brooders would be best, unless one used a small size oil stove during the days, which would be necessary only on cloudy days, the sun being usually sufficient to keep the chicks warm while exercising.

For summer use, I can testify to their complete success, for the raising of both chicks and turkeys, but only 25 chicks, or 15 turkeys should be kept in a flock in one hover, which makes it difficult to care for a large number all wanting to be tucked into bed at once.

It is claimed that the chicks soon learn to go into the hover, as under a hen to get warmed up during the day, but either my chicks were "contrary" or not properly taught, for they insisted upon staying out until put in at night. But they did thrive and grow well, which is all that one can ask or expect.

### CULL OUT ALL INFERIOR CHICKS.

If farmers are looking forward to the time when they shall own hens capable of laying 200 eggs each per annum, some attention must be given the selection of the parent birds, and close observation and selection of the chicks should be the rule.

Farmers are not sufficiently careful regarding the stock to be retained for the succeeding years. Chicks are kept for months that do not show the least signs of growth in that time, and hours of labor are lost in caring for some that should be sold or destroyed even when healthy.

If only the best fowls were retained and the inferior ones discarded as soon as they show that they cannot keep up with the others, there would be a great deal of saving of both time and food, and more room might be secured for those that are retained. Inferior chicks or adults will amount to nothing but a loss in the end and they should be gotten rid of before they cost the owner more time and money. Many young fowls that are kept until quite large should be eaten by the owner, and thus save a small sum in the meat line, instead of retailing expense.

Only a small proportion of the farmers have ever made poultry pay. Generally if hens have paid on the farm, they deserve all the credit. There are no fabulous profits in poultry, nor is the capital required much less than for other stock, but the losses are sooner recuperated and better prices are obtained. The returns from poultry and eggs are constant. There is always a retail demand which the farmer himself can regulate and supply.

The most careful experiments have demonstrated that each hen in a large flock should give a profit of $1 a year. Some hens will pay nearly twice as much, while some will not pay at all. The cost and profit are regulated by circumstances, as is the case with all industries. Much improvement will result if farmers will take hold of this matter and give their attention to culling and selection as early in the year as possible.—The Poultry Yard.

The faster you can make the pullets grow without putting on extra fat, the sooner they will begin their life work.

# Coulson's EGG FOOD

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

# Bees and Their Care

## HONEY VERSUS CANE SUGAR.

A CHILD'S craving for sweets of some kind shows a real need of the system in that direction; but, unfortunately, the sweets at hand and usually given to supply this need are not wholesome, and serve no better purpose than to please the child's taste. In fact, the work of changing the cane sugar into grape sugar so that it may be assimilated is often too great a tax upon the child's stomach, and sickness results. This, however, is not the case with honey. The bees have fully prepared it for immediate assimilation, and it is ready to be taken into the system without taxing stomach or kidneys. Doctors frequently order honey for those whose digestive organs are too weak to convert cane sugar into grape sugar properly. The wholesomeness of honey, however, is not disputed by those who know anything about the product of the hive. The principal difficulty in the way of its substitution for the sweets usually craved by children is the apparent limitation of its use. The child has an inordinate longing for cakes and candy, and that is not always satisfied by bread and honey; therefore, to take the place of cane sugar honey must be prepared in the same manner as cane sugar. It must be made into cakes and candies and other dainties dear to the children. The object of this article is to supply housekeepers who desire to substitute honey for cane sugar, in the diet of their children, with a few simple recipes, obtained from practical experience, for making this wholesome sweet into a variety of pleasing confections.

A few suggestions on the care of honey may be of benefit to those who are so situated that it is cheaper to buy in quantities. The worst place to store honey, or even to keep it for a short time, is in the cellar or any damp cool place. Honey, when extracted from the comb, readily absorbs moisture, becoming thin, and (in time) sour. The very best place to store honey is in the attic, up next to the roof, where it is hot. During cold weather, honey that is kept any length of time has a tendency to granulate, turning to a white, semi-solid granular condition. This is called "candied honey," and it frequently "candies" so solid that it must be dug out of the bucket with a knife. It is a simple matter, however, to restore it to its former condition. Place it in hot water, never over 160°, and let it stay until it has liquefied. It may take an hour or it may take a whole day.

In the following recipes quantities are given in pints and pounds because the success of honey recipes depends upon the right proportion of the ingredients. All cups are not the same size, and do not hold the same quantity of material, therefore it is best to use a standard measure.

The simplest honey cake is the honey ginger-snap.

One pint of honey; ¾ lb. butter; 2 teaspoonfuls ginger.

Boil together for a few minutes, and allow it to get nearly cool. Add enough flour to make a stiff dough, and roll out thin; cut into round cakes and bake quickly.

Another simple cake is the cooky. The recipe is given for a large quantity because they will keep indefinitely, and they are nice to have in the house all the time for the children to eat between meals. If they are wanted in smaller quantities the recipe can be reduced a half or even one-quarter.

One pint honey; 1 quart sour milk; 1 teaspoonful soda.

Mix well together and add sufficient flour to make a soft dough. Roll moderately thin and cut into round cakes. Bake in a slow oven to prevent burning.

A richer cooky is made by the addition of butter and eggs. One pint honey; ½ pound butter; 4 eggs; ½ pint buttermilk or clabbered cream; 1 quart flour; 1 teaspoonful soda.

Mix the honey and the butter and the eggs well and add the buttermilk. Sift in the flour and soda, and mix well. Mix in enough flour in addition to the quart to make a cooky dough that will roll out well without sticking; cut in round cakes and bake in a slow oven.

In the line of confections, some sugar must be used to make the honey "candy;" but the home-made caramel has the advantage of being pure.

One pint honey; 1 lb. sugar; scant gill of cream.

Boil until it makes a soft ball when dropped into water. Stir in a teaspoonful of vanilla, and pour it into a shallow buttered pan to the depth of about half an inch. When cool enough to prevent its sticking to the knife, cut into inch squares. If chocolate caramels are desired, use a tablespoonful of melted chocolate instead of the vanilla, stirring it in just before pouring into the buttered pan.

To make honey popcorn balls, boil a pint of honey in an iron frying-pan until it is quite thick, and then stir in the popped corn. When cool, mould into balls.

As a substitute for tea or coffee for children there is nothing better than honey tea—a very simple tea made by adding a tablespoonful of honey to a cup of hot water. If not sweet enough to suit the taste of the child add more honey.—Mrs. Winslow in Gleanings.

## BUYING BEES AND BEE YARD.

Try and get them close to your home for the reason that jarring or disturbing the hives and combs is not conducive to obtaining the best results the first season. Buy three to five swarms, set them in a sheltered place with the hives so tipped that the entrance end is at least 3 inches lower than the opposite. Bees can put in time better making honey than cleaning out hives up hill and every mechanical advantage given is just that much time saved for honey production.

A sheltered place should not be so sheltered that the wax is stiff from low temperature in the hives, nor exposed so that the sun's rays beat onto the hives, keeping the bees hanging on the outside waiting for a temperature that permits the comb construction inside. From 6 to 8 inches off the ground is the most convenient height for working around the bees comfortably.—Farm Stock and Home.

## RVESTING ALFALFA FOR SEED.

IN harvesting alfalfa for seed, cutting should be done when the greater proportion of the seeds are hard, but not sufficiently ripe to shell. At this stage a majority of the pods are turned a dark-brown color and the seeds are fully developed. Frequently the cutting can be raked into windrows after two hours if the weather is drying, and in two or three hours more put into cocks and let stand from twenty-four to forty-eight hours, as the weather may justify. It should, however, be well cured and thoroughly dry when put in the stack, or there is danger of heating, and stack-heating seriously injures the vitality of the seed. It is not uncommon, if extremely ripe, to leave the cutting in the swath only an hour or a half-hour, then stack, and let stand for autumn or later threshing. If allowed to stand in the stack for about thirty days, the entire mass goes through a sweating and curing process which makes the threshing easier, while less of the seed is left in the straw than would be if it had not been stack-cured. In western Kansas many seed raisers cut their seed crop with a self-binder, put the sheaves in shocks the same day and thresh in about ten days, or put them into a stack to await a convenient threshing time. They claim to secure 20 per cent. more of the seed in this way than if they cut with the ordinary mower. Others cut with a mower having a dropper attachment which leaves the alfalfa in small bunches at the will of the driver, in the center of the swath, and these are "straddled" by the team and the wheels of the mower in the subsequent rounds. These bunches are left for two or three days and then stacked. There is little, if any, danger from mold or spontaneous combustion in stacks of alfalfa cut for seed, but there is danger of the seed heating in the stack if stacked when damp. If bright, clean seed is expected, the stacks must be well topped with slough grass, covered with tarpaulins or boards, or given other protection. It is better still to put the alfalfa intended for seed into a barn.

One western Kansas farmer reports that he used a self-binding harvester, shocked the sheaves like those of grain, let them stand ten days and then put in a mow, with no bad results.—From Coburn's "The Book of Alfalfa."

## SCHOOL OF AGRICULTURE.

The College of Agriculture of the State University has just issued its Circular 45, announcing the Short Courses for farmers, to be given this fall on the University Farm at Davis. The plan is much the same as that of last year, but with some significant changes. The courses are intended for busy people, who are not able to take much time from their work. To suit their convenience the courses have been condensed as much as possible, by beginning each day's work a little earlier and closing a little later, and by the use of evening lectures. In this way, every course save that in Dairy Manufactures is made a week shorter than it was last year, while the same amount of work will be done. A new course is offered in the dairy department, in Market Milk and Cream Supply.

A new feature which has been tried elsewhere with great success is the institution of "Farmer's Week." This is for the purpose of concentrating into the shortest possible time the greatest possible amount of valuable and stimulating suggestion and instruction in agricultural topics. No California farmer can afford to miss this week. It is hoped that every one who attends any of the short courses may include this week in his stay at the Farm, and that many who cannot take time for other more extended courses will succeed in coming to "Farmer's Week."

Last year more than a hundred students were enrolled in the Short Courses. It is expected that a much larger number will attend this year. A list of the courses, with dates, is appended; and Circular 45 will be sent upon application to the Superintendent of Farm Schools at Davis.

**Short Courses, 1909.**

Dairy Manufacture.—Eight weeks: Oct. 4th-Nov. 24th.

Market Milk and Cream Supply.—Two weeks: Oct. 11th-24th.

Irrigation, Fertilizers, Field and Forage Crops.—Two weeks: Oct. 11th-23rd.

Poultry Husbandry.—Two weeks: Oct. 11th-23rd.

Animal Industry and Veterinary Science.—Three weeks: Nov. 1st-19th.

Horticulture, Viticulture and Entomology.—Two weeks: Nov. 1st-13th.

Farmer's Week.—Oct. 25th-30th.

The 31 Year Old **SUCCESS SPREADER** Roller Bearing

Free From Cog Gears—Direct Chain Drive—Light Draft—Choice of Everybody Who Really Knows Manure Spreaders.

Why experiment? The Success is in use at nearly all Agricultural Colleges and U. S. Experimental Farms. It makes you sure of right work and right working. Parts simple—everything direct—free from breakage—long lived. A generation of experience in it—it has been the leader from the first. Distinguished features made exclusive through patents.

Equipped With Either Steel or Wooden Wheels

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Milk For Young Colt.

A subscriber has a fine colt of draft horse type, weaned, but which he wishes to feed up so as to secure best results. Is feeding whole cow's milk. Wishes to know if skim milk will answer as well. Mrs. Sherman answers: We raise the orphan colts on separator skim milk. It must be absolutely sweet. Where there is a separator run twice a day at the ranch this is entirely practicable. To each quart of the milk add a tablespoonful of lime water and a level teaspoonful of sugar. Feed the milk blood warm or about 98 degrees of heat. If the milk is not run through a separator at home I should feed him fresh cow's milk reduced by adding one quarter water or if the milk was very rich add a third water. Use the water from the tea kettle that has been boiled. Add the sugar and lime water the same as for the skim milk. Mare's milk is sweeter, has more mineral matter and much less fat than cows milk. The idea is to imitate it as closely as possible. Two per cent of fat is about the average of the fat in a mare's milk while the family cow will average about four per cent. Pick out a handful or two of alfalfa leaves and put in a small box for the colt to nibble. Our draft colts eat it freely at two months old as well as considerable grass. The thing to avoid is heavy grain with a colt. We have lost two that ate from the rolled barley at their mother's side. Keep everything used scalded well, as scours are the cause of most colts' deaths that are raised by hand. The excess of fat in the cow's milk is a fruitful cause, cold milk another, and lack of sterilization of milk pans the third. If these things are done the colt will thrive and make as good an animal as though he had been raised by his dam. The best way to feed him is in a pan about four or five inches deep for then he has to drink slowly. If a pail is used the colt often chokes himself as he gulps the milk down. I have often observed that the big bellied horses predisposed to scours have this way of drinking and if they are made to drink slowly the scouring difficulty passes away. With scours often comes colic and that kills more horses and colts every year in California than any other single cause.—M. E. S.

### Abscess.

Will you kindly tell me what is the matter with my cow? Three months ago her throat and the side of her head swelled up, but swelling all disappeared in two days. This occurred several times. Now it has settled into a permanent bunch on the back of jaw running down from the ear. It is pear shaped and seems to be loose, not attached to the jaw. Is this lumpy jaw, and can I cure it?—A. L. C., Gardena.

This is not lumpy jaw as it is not fastened to the bone. It may be an abscess that will come slowly to a head and break. If it is discovered to have matter in it, it had best be opened at the lowest point so that it will drain out. Then cleanse it with a peroxide of hydrogen in water daily until there is no more pus formed. I view all abscesses around the glands of the neck with suspicion, as this class of troubles does not come in the tuberculin tested herd except from a fox tail. I would have the cow tested at once before attempting to doctor her. If she does not react and is not condemned, it would be well to use tincture of iodine on the lump until it is well roughened. Then grease it until the pimples subside, Continue use of iodine until lump is absorbed.—M.E. S.

### Use of Teat Plug.

Please explain use of teat plug.—A. L. C., Gardena.

The teat plug is used as a distender of the duct of the teat when the milk comes out in too small a stream. The plug is greased and inserted after each milking for several days until the teats milk alike. The other use, which is of far more importance, is in cases of injury to the teats. After the outside stitches are placed in the teat to hold the wound together, if the inside of the duct is not distended, it will fill with granulations. The lead plug prevents this trouble. Sometimes it is necessary to enlarge the opening of the teat. This is done with a specially prepared covered lancet and requires considerable skill. The plug again is used to preveut granulation from closing up the opening. This cutting of the teat when it is done close up to the udder is not good practice as the wound is very slow to heal and often runs into inflammation. I do not like the operation and would rather beef the cow than do it. The best way to have a cow's teats and udder perfect is to breed from one of the old established breeds of dairy cattle, as in these breeds the tendency to malformations has been bred away from and the chances are remote of this trouble coming out in the decendants.—M. E. S.

### Seeding Alfalfa.

Is it advisable to grow alfalfa between rows of orange trees? Will it retard growth or harm the trees? How wide a space should be left each side of this strip of alfalfa for clean culture?

What is the best time for planting Valencias and alfalfa?—C. S., Anaheim.

If the trees are young it is possible they would suffer no injury from planting a strip of alfalfa between rows. We have known of this being done in walnut orchards where the trees were young and set 40 or 50 feet apart. The alfalfa did well and no apparent injury resulted to the trees. It must be borne in mind, however, that the orange demands a warmer soil and will stand less wet feet. Therefore if the strip of alfalfa comes very close to the row, tne roots of the orange may get too wet and cold and injury will result. Some of our subscribers who believe in green manuring regard alfalfa as a good manure crop and are going to test it out this fall. After it has been tried out we will be able to give definite information. If you try it you should watch very carefully the condition of your trees and the moment any yellowing or unhealthful appearance is observed, you should plow it up. In such case, it would be advisable to return to the soil any elements that the alfalfa may have removed. The soil would be left fully as rich in nitrogen as before planting the alfalfa, but the other elements would be materially reduced.

Next month will be a good time to plant alfalfa. Valencia oranges should be planted in March or if in section

**125 to 140 lbs. of Grapes to the Vine**

### Sun Flower Seeds.

Have you or any of your readers had experience with sun flower seeds for fattening hogs or turkeys? Would you advise it as good feed?—Amateur, Morganhill.

This is a question that we will pass on to our subscribers for answer. We presume it would be rather expensive as a feed for hogs. For turks, for one element of the feed, it would be excellent and, in fact, is often used. We do not believe it would be advisable by any means to make it a continuous diet, but as a balancer for other grains we think it would be a fine addition to the ration.

### Alfalfa Following Alfalfa.

Please tell me if it is all right to plow up old alfalfa pasture and sow to alfalfa again.—E. F. J., Turlock.

We have heard of cases of alfalfa following alfalfa which has been planted for several years. We would very much prefer, however, to rotate, giving at least one year to clean cultivation to some crop like melons, corn or sugar beets. An old worn out alfalfa field is reasonably sure to be foul with weeds and wild grasses. It would be exceedingly difficult to get a good stand of alfalfa in company with all these seeds. If the inquirer has a dairy, corn could be planted for soiling or for putting in silo. At any rate we would think it advisable to use some crop other than alfalfa if possible.

### Caterpillar of Tiger Moth.

I send you specimen of caterpillar many of which I find on the bases of my orange trees. What is it? I think the queries the most interesting part of the paper and always turn to that department first on opening it.—Subscriber, Highland.

The caterpillar was referred to Mr. S. A. Pease of San Bernardino, who writes:

"The caterpillar is the larva of one of the family Arctiadae,—is a noctuid moth, and feeds upon herbaceous plants, and many species seem to have but little choice of food-plant; but certain common species feed upon leaves of forest trees. Their name is taken from the Greek word for bear. The caterpillars of most of these tiger-moths are thickly covered with hairs, whence they have received the name of wooly bears.

This is as close as I can come to giving you the proper name for it.

### Walnut Grafting—Grafting Wax.

Please give formula for grafting wax. What strain is best to graft on California walnuts? What time of year is best to collect scions for grafting from English walnut trees? When is grafting done?—H. L. D., Stockton.

There are many formulas for grafting wax. We give two, which we presume will be quite sufficient. Two pounds tallow, two pounds beeswax, four pounds resin. The other is: One-fourth pound tallow, two pounds beeswax, two pounds resin, little linseed oil. Melt with gentle heat and when thoroughly mixed it is ready for use and should be kept melted during grafting by setting on a hot brick or a small oil stove.

The best strain for grafting depends upon the section. For Stockton the best information as to strain can be secured from orchardists in that neighborhood. The soft shell which has been such a success in Southern California would be of no value whatever there. The Mayette and Franquette, especially the latter, have proven favorites for that section. There are various strains of these going under different names which would doubtless prove successful with you.

The scions are collected while dormant, but usually as late as possible in the spring, so as to have cut as little time as possible before the grafting.

The grafting is done as soon as the sap begins to flow freely in the spring. Before that time comes, the Cultivator will have articles on walnut grafting which will be helpful to our subscribers.

### Bark Scaling Off.

Enclosed I send portions of bark from an orange tree. I have a number of trees from which the bark is scaling, generally from the trunks, but in some cases from the limbs also. Can you tell me the cause and remedy?—F. D., Azusa.

This query was referred to Prof. R. E. Smith of the Pathological Station at Whittier. He writes: The enclosed does not seem to represent the ordinary scaly bark disease, neither is it typical of the gum disease or gummosis. The latter affects ordinarily only the lemon, being found more rarely on the orange. In typical cases the gumming and separation of the bark occurs only near the ground on the trunk just above the point where the tree was budded. In this disease the bark is separated from the wood, the rupture coming at the cambium or place where the bark and wood come together. Scaly bark may occur at any place on the trunk or limbs and is characterized by the separation and scaling off of the outer bark only, the separation being between the outer and inner bark. There is rather less gumming in this than in the other disease and the gum oozes out in small drops here and there instead of forming large masses and separating the bark from the wood. In the present case the samples submitted do not seem to represent either of these diseases, but I would advise your subscriber to cut off all the affected limbs and form a new top rather than to attempt to treat them in any way.

### Dressing For Canvas.

Please give me dressing to put on canvas to protect it against the wet. What is the cost?—J. W., Reedley.

The best dressing of which we know is hot linseed oil which makes the canvas almost entirely water-

(Continued on Page 311.)

# Household Department

### WHICH WAS THE WISER?

Two men toiled side by side from sun to sun,
And both were poor;
Both sat with children, when the day was done,
About their door.

One saw the beautiful in crimson cloud and shining moon;
The other, with his head in sadness bowed,
Made night of noon.

One loved each tree and flower and singing bird
On mount or plain;
No music in the soul of one was stirred
By leaf or rain.

One saw the good in every fellow man,
And hoped the best;
The other marveled at his Master's plan
And doubt confessed.

One, having heaven above and heaven below,
Was satisfied;
The other, discontent, lived on in woe
And hopeless died.

Sarah K. Bolton.

### BRINDLE COW MIXED UP IN POLITICS.

"IS THERE anybody here," said the stranger, his vehemence of manner being in such contrast to the placidity of his countenance that it was startling, "who can tell me why it is that a fellow citizen's high ambition has got to be sot down onto and the pole star of his existence put in total eclipse because the female sex is vain and man persists in building a smokehouse when he can buy good ham for 9 cents a pound?"

There was nobody present ready with an answer, but the landlord said to the vehement stranger that there was a cheaper hotel up at the other end of town. If the stranger heard the landlord's suggestion it did not appeal to him. He took a long breath and burst forth again:

"Then it's plain to me that the news of Jake Goble's wife's red felt bonnet with the blue rooster tail in it and the smokehouse Bill Hooper built hasn't got over as far as this yet. Has it?"

The news was still due, so they told him.

"Do you want to tell me, then," he exclaimed, "that the news of the pole star of my existence and its total eclipse is likewise as yet unbulletined, so to speak, in this bailiwick?"

They must have wanted to tell him so, for they told him nothing doing whatever in pole stars of anybody's existence.

"And yet," said the man bitterly, "they boast to me that the telegraph and the telephone and the newspaper have sent the sewing society and the quilting bee to a back seat. Bah! Don't you s'pose that if it had been left to the sewing society or the quilting bee that you'd have heard long before this how I went to Bill Hooper almost with tears in my eyes, knowing that he needed a roof on his woodshed and his garden fence jacked up a good deal more than he needed a smokehouse, and pleaded with him not to do it? Don't you?"

No one seemed to care to commit himself.

"Don't you s'pose that if it had been left to them," the vehement stranger persisted, "they'd have spread the news to you long ago that, although Jake Goble's wife did have her heart wrapped all around that red felt bonnet with the blue rooster tail in it, she'd have to unwrap it if it hadn't been for Bill Hooper's smokehouse?"

"I'll say yes," said the landlord, "and if you're waiting for the Pine Island train it goes at 7:07. It's 2:06½ now. My watch is a little slow at that.

The vehement stranger wasn't waiting for the Pine Island train and time seemed no object to him.

"That for your telegraphs and your telephones and your newspapers," he said, with a contemptuous snap of his fingers. "Bah! Why, I'll bet a hen that they haven't got here yet with the news even of how for something like ten years I had pined to be Constable of the Huckleberry Hill. I'll bet a hen they haven't!"

Somebody said something about some folks always being ready to bet on a sure thing, but the vehement stranger did not heed it.

"Yes!" said he, 'and I'll double the bet and throw in a flock of ducks that they are still shy in arriving with the news that for ten years my fellow citizens persisted in lifting someone else to the Constable's office year after year, but rallied as one man at the last election and hoisted me to the place. What takers do I hear for that?"

If he heard any he could hear a pin drop in a boiler factory.

"It wouldn't surprise me, though," said he, "if they had got here with the news before it was half a minute old that some folks make no bones of saying that if Sam Rigby, who was running for Constable against me, hadn't had a stroke election morning and hauled off I wouldn't have been lifted in even that time. It wouldn't surprise me a bit if they got here quick with that kind of news.

The landlord said that it wouldn't have surprised him either.

"But I would be surprised," continued the stranger, "if they had added to it the news that I scorned those folks and their insinuations as I saw myself Constable and that I unbosomed myself to my friends and fellow citizens and said:

"Constable ain't the pole star of my existence! Not by a jugful it ain't! It's only a stepping stone! It's Sheriff next, and then Legislatur'! That's what the pole star of my existence is, and if I don't clutch it I'll eat the greaser!

"I would be surprised, indeed," he exclaimed, "if they had added that news to it!"

Then he paused and pondered a while and said:

'Yes, I told 'em that if I didn't clutch it I'd eat the greaser. I ought to be a man of my word. Have you a greaser in the house?"

The landlord said he had, but it wasn't on the menu that day. The stranger mused a while and then exclaimed:

"But how could I have foreseen Jake Goble's wife's red felt bonnet with the blue rooster tail in it, and Bill Hooper's smokehouse? Some-

body tell me how I could and hear the cash register jingle!"

The man behind the counter looked them over with a show of pleasant expectation that this inducement might prompt some one to some plausible speculative opinion at least, but none was ventured. The man behind the counter seemed disappointed. The vehement stranger didn't. He didn't even pause for a reply, but went right at his subject again.

"And can it actually be," said he, "that I've had to bring the news over here myself that I'm charged with stealing a brindle cow?"

The landlord suggested that maybe the stranger had got twenty-four hours the start of 'em and kept right on going.

"That might explain it," said he.

Not to the stranger's satisfaction evidently, for he ignored it, and snapping his finger contemptuously again, said:

"That for your telegraph and your telephone and your newspapers! Listen to me! When old man Frazer hired Jake Goble to tear down his old barn and take his pay for it in the hemlock boards and stuff that come out of it the eclipse of the pole star of my existence began.

"Two dollars and forty-seven cents was the spot cash price Poly Skiggins, the milliner, wanted for the red felt bonnet with the blue rooster tail in it that Jake's wife had her heart wrapped around; but Jake's wife didn't have the two forty-seven. So Polly said she'd take a quart of milk a day from Jake's wife in pay. Jake's wife said she'd be tickled all to pieces to pay for the bonnet with milk, and she'd do it in a minute only for one thing. She didn't have any cow. Not seeing any way by which she could get around that little obstacle, Jake's wife would have had to unwrap her heart from around that bonnet if it hadn't been for Bill Hooper's smokehouse.

"Bill had given up that smokehouse, not because I had argued with him and shown him how incompatible a new smokehouse was with no roof on his woodshed and his garden fence down flat, to say nothing of his having to buy pigs to get hams off of to smoke in the smokehouse, while he could get good ham already smoked for nine cents a pound—he hadn't given it up because of that incompatibility, but for the sufficient reason that when he came to go ahead with the building of the smokehouse it dawned on him that he had no lumber to build it out of, so he had concluded not to build it.

"But Bill had a brindle cow. Jake Goble heard about Bill and his smokehouse and he went over to Bill's and he said:

"My wife's talking about gettin' up a deal o' some kind with Polly Skiggins, payin' milk for a bonnet or somethin' like that. I've got a snag of hemlock stuff I took out o' old man Frazer's barn, but it won't give no milk. Nor I don't see how you can make a smokehouse out of a brindle cow. I'll swap you hemlock for cow.

"Bill saw the logic of Jack's dicker and fell in with it, but while he was on smokehouse bent he had a frugal mind.

"'My brindle cow is worth $25,' said he. 'Your hemlock ain't worth more than $10.'

"'Free to admit it,' said Jake; 'and easy fixed.'

"The upshot of it was that Jake gave Bill the hemlock and his note for $15 and Bill gave Jake the brindle cow. Bill got his smokehouse. Jake's wife got her red felt bonnet with the blue rooster tail in it. The right lobe of the pole star of my existence passed into the shadow.

"Jake's note fell due. Settling things being incompatible with Jake's disposition, Bill sued on the note and got judgment. I had in the meantime been hoisted by a rallying constituency into the office of Constable of Huckleberry Hill and was on my way to clutch on the brindle cow and posted her for sale. Three days before the sale she got away somehow and was lost. Responsible for her custody, I scoured the county for her, and the day before the sale found the brindle feeding by the roadside six miles from Jake's. I drove her in, glad hearted, and next day knocked her down to the highest bidder. The pole star of my existence, so I thought, was beginning to blaze like the sun.

"Next week in came Farmer Benson, mad all the way through.

"'Nice work!' said he to me. 'Runnin' off my brindle three-year-old and selling her to make good your losin' that eel rack of Jake Goble's, old enough to be her great grandmother!'

"Sure as beeswax, the brindle turned out to be Farmer Benson's, and the citizen that bought her had to give her up and he fell back on me for the money, all paid out and distributed in costs. Then some one found Jake's old brindle dead in Bulger's Swamp and Jake falls back on me to pay for her, because he intended to buy her in at the sale, but didn't when he saw I wasn't selling her. And to top it all Farmer Benson charges me with stealing his brindle cow, and I'm out on bail!

"And now," said the stranger, vehement of voice but still placid of expression, "is there anybody here who can tell me why it is that a fellow citizen's high ambition has got to be sat down on to and the pole star of his existence eclipsed because the female sex is vain, and man, looney man, persists in building a smokehouse when he can buy good ham for nine cents a pound?"

Even yet nobody seemed capable of the answer, and the stranger, pounding the arm of his chair, exclaimed:

"I give notice right now that if there's anybody that wants to put himself in the hands of his friends to be triumphantly hoisted from the humble walks of life 'way up into the office of Constable of Huckleberry Hill he can do it at once, for I've sent 'em word that the pole star of my existence is nothing but a hole in the ground bigger than a Dutch barn, and I've quit!"

No one made responsive comment, but when the vehement stranger went out some one was moved to remark that it beat all what queer things did blow in here since Goshen was connected up with Middletown by trolley.—N. Y. Sun.

---

O, the days gone by!
The apples in the orchard, and the pathway through the rye;
The chirrup of the robin and the whistle of the quail,
As he piped across the meadow, sweet as any nightingale;
When the bloom was on the clover, and the blue was in the sky,
And the happy heart brimmed over in the days gone by!

The Big Exclusive Piano House

The Autopiano

Sole Agency for the Autopiano, the best Player-Piano in the World.

**Over 15,000 Rolls of Music in our Free Library**

We furnish music free and change as often as desired.

| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

Scott, Magner & Miller say

Arlvals of hay for the week have been 4000 tons. The majority of this amount has been made up by extensive arrivals of alfalfa hay, and of medium and poorer classes of horse hay. There have been very few choice lots of hay received here for the last ten days, with the exception of some choice cultivated wild oat hay.

The medium and poorer offerings have been dull, slow, and thoroughly neglected, as there is not much demand for this type of hay. Consumers have become so particular that they do not take up the ordinary types of hay, as they did in former years, and will not buy such poor classes of hay, except under exceedingly attractive conditions.

On the other hand, choice lots of hay have found a ready sale here during the week and toward the end of the week an element of strength was developed on choice wheat hay and choice red oat hay, as well as choice cultivated wild oat hay.

The fields are being rapidly cleared of all good lots of hay, but the other varieties of hay are still in large supply, and buyers are being urged from day to day to make offers on such lots which are still in the field in districts where they are unprotected. It is now getting late in the season, and rains may be anticipated, which fact is making the larger holders of hay still in the fields somewhat nervous.

Alfalfa hay, which has been arriving freely, and the sale of which has not been as active as was anticipated, has shown some weakness, and some little effort must be used in effecting sales.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 18.00@19.00 |
| No. 1 wheat or wheat & oat | 17.00@18.00 |
| No. 2 wheat or wheat & oat | 14.00@15.00 |
| Choice tame oat | 16.00@17.00 |
| Other tame oat | 12.00@14.00 |
| New crop wild | 11.00@14.50 |
| Stock hay | 8.00@9.00 |

| Mixed feed per ton | 25.00@30.00 |
| Shorts | 31.50@33.00 |

## Citrus Market

LOS ANGELES, Sept. 22, 1909.

The Valencia market is somewhat embarrassed by liberal proportion of off sizes and low grade fruit. There is also a large quantity of grapes and peaches in the far Northeastern market, but notwithstanding these factors, a fair condition prevails. No shading of prices has been noted as yet and the system of distribution is such that it is hoped they will be maintained.

The lemon market is exceptionally strong and all good stock is being taken readily.

**SHIPMENTS.**

Total shipments of citrus fruits since November 1, 1908, aggregate 36,879 cars, of which 30,906 were oranges and 5,973 lemons.

---

NEW YORK, Sept. 20.—Seventeen cars sold. Market strong on regular sizes with advancing prices. Cloudy. Cool.

## Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Possibly Abscess.

My registered Holstein bull has been lame in his left hind leg for eight or ten months and now there has appeared on the top of his left hip a large pone of blood half as large as a man's head. His left knee is also swelling in front.—O. P., Porterville.

Cut the "pone" open and clean it out, using a solution of phenol daily in the proportion of one to one hundred. A piece of broken bone or foreign substance may be found in the "pone." There are many things that might make a bull's knee swell. Give it a closer examination.—R. T. W.

### Poor Dentistry.

I had my horse's teeth filled and one tooth pulled. Since then he can hardly drink, taking twenty minutes to drink a pail of water.—Subscriber, Porterville.

You have had a bad job of dentistry. Either the jaw or a tooth has been broken. Have the horse examined by the best veterinarian you can get. You will find this cheapest in the end.—R. T. W.

### Cure for Scours.

My mare has scours badly. She is fed oat hay.—Subscriber.

Make a complete change in feed. Try thoroughly cured alfalfa. Give no water for an hour after feeding, and only a small amount at a time. Mix thoroughly two pounds of French chalk and one-half pound of Gallic acid. Give a tablespoonful in each feed of grain. Increase the dose if necessary.—R. T. W.

**DR. WHITTLESEY'S VETERINARY REMEDIES.**

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

## UNFAIR COMPETITION.

In remitting for another year's subscription to the Cultivator, Mr. P. H. Dreiser of the San Gabriel Floral Nursery refers to the Japanese question as it affects producers, especially in the San Gabriel Valley. Mr. Dreiser says:

"If the effect of the Jap on the fruit and nursery business of the past year can be taken as a criterion for the future, then the Cultivator will not be needed in this valley much longer, for the Japs can cultivate without the "Cultivator" and the American cannot compete with the former because he cannot come down to his standard of living and establish a home and provide a competence for his old age."

This may possibly be true, although we believe the American people will preserve our more beautiful valleys for Americans, but it must be admitted that there have been trying cases where the greatest injustice has been done to the American in this state. This must in time be corrected.

## Business Notes

### HOW HE SELECTS HIS CREAM SEPARATOR.

The ordinary farmer has no expert knowledge of cream separators, but knows in a general way that they are progressive and beneficial from the fact that their use is growing continuously, especially among the up-to-date dairymen over the country.

The sensible view taken by a hard-headed, intelligent German farmer strikes us as being a pretty good plan for the ordinary farmer to follow.

He says: "I did not know anything about the merits of the machines from an investigation of them myself, because I am not an expert, neither am I an expert in medicine, and I therefore consult a doctor when anything is the matter that I do not understand in regard to myself or family. I therefore looked around and observed that the experiment stations, the agricultural colleges, the majority of the winners in the butter contests and a large proportion of the up-to-date scientific farmers were using the De Laval separator. Now this was as good an endorsement as I could hope for, acting just as these wise men who are experts in their lines and in the dairy business, whose experience and knowledge and wisdom enabled them to select the De Laval. This was all the evidence that I wanted of the value of this well tried and highly appreciated machine, and I bought the De Laval, and am glad that I did so."

This certainly is a very sensible view, and it is always likely to lead one to the right conclusion. You take the experience of the competent and capable man, who is making a success of his business, and the result is you are benefiting yourself by using the other man's experience and without his cost.

We can say to the farmer who is at a loss to determine what machine to buy to take advantage of this sound, sensible, thrifty German and follow his plan, and you will land in the right spot.

### BROWNSBERGER.

One of the most progressive educational institutions of the Southern part of the State is the Brownsberger Commercial College. This college has just added a number of teachers to its faculty. The summer season, which closed September 1, had the largest enrollment in the history of the summer school. The September enrollment is the largest of any fall term to date.

While the college is a California institution, the class which graduated last Spring contained members from nearly every state in the Union, which shows the wide influence of the school.

Pupils graduating from this school readily secure good positions as the name Brownsberger is so well known in the Pacific Southwest that they need no further recommendation. Every boy or girl desiring a good commercial education should write to the Brownsberger Commercial College, 953-957 West 7th St., Los Angeles, for information in regard to the school, which will be sent free if you mention the Cultivator.

### QUERIES.

(Continued from Page 307.)

proof. It is of course liable to cause the cloth to crack if folded when it gets thoroughly dry and hard, but where the canvas is stretched over a frame, linseed oil does the work thoroughly.

### Pumpkin Seeds For Cows.

Will pumpkin seeds fed freely affect the flow of milk?—Subscriber, Covina.

Mrs. Sherman has answered this question in prior issues to the effect that as ordiarily fed the cow will not suffer nor will milk flow shrink. If fed in large quantities it is possible they might so stimulate kidney activity that weakness and possible injury might result, but the seed are rich and as ordinarily fed will do no harm.

### Unfermented Grape Juice.

We have request for information as to manufacture of unfermented grape juice, and refer inquirer to Page 270 of our issue of September 16th which gives a reprint of an article appearing in the Cultivator a couple of years ago.

The meeting called at Garfield last week to discuss the question of the smutting of wheat resulted in the formation of an anti-smut club, the chief object being to lay the foundation for an effective campaign against the pest.

The oldest inhabitant at Greenview, Siskiyou county, has observed that yellow jackets and hornets are thicker than usual and from this he predicts a hard winter.

The winery at Roseville is contracting with grape growers of that section to purchase wine grapes at $15.00 per ton for fifteen years.

90 H. P. "Western" Pumping Water for Western Water & Power Co., Glendora, Cal.

# A Vast Difference

exists between "good enough" and "the best." There are any number of gas engines which are "good enough" for many purposes and people, but only "the best" should be considered for any high class proposition.

The **WESTERN** is the **best** gas engine built on the Pacific Coast, and while the first cost is of course more than that of the very cheap engines, yet it is no more than that of any standard engine, and this necessary difference in price is soon liquidated by the greatly lessened cost of fuel and repairs, after which your engine is a paying investment and a constant source of satisfaction to you.

The **WESTERN** saves 25% in fuel cost over other makes, being able—by reason of its special patented features—to develop a horse power hour with the least amount of the cheapest fuel.

With the Nix-Frost Crude Oil Gas Producer (Patented) a gallon of **Crude Oil** has the same power value as a gallon of Distillate. Ask us about it.

## Pomona Grange at Tulare County Fair

CENTRAL CALIFORNIA claims and we believe with justice, that some of her fairs are fully the equal of the state fair in the matter of interest taken by eitizens and in the quality of exhibits made. A very few of these county fairs are yet largely speed meets, but Tulare claims a genuine agriculture fair. That county boasts of many big things; the mountains ranging her eastern border, the monster sequoias, and the crops she raises, all inspire her people to think big and do big. The fair grounds are not exactly in this category, but are exceedingly well planned, and all the proceedings of the fair have been entered into with such spirit that a most excellent exhibit resulted.

One of the principal exhibits in the pavilion was made by the Pomona Grange of Tulare County, an engraving of which appears above. In this were shown many varieties of fruits and nearly all kinds of agricultural produets. This exhibit won first prize for the largest display in the entire pavilion. There are many granges in Tulare County which is perhaps the best grange county in the state.

Another excellent exhibit near the entrance of the pavilion was made by the Tulare Experiment Station. This station is under the supervision of the State University and has been most helpful to producers in this section in showing some of the products most successfuly grown. Over twenty varieties of wheat were displayed, ranging in production from eighteen to fifty sacks per acre.

The Cultivator representative had the pleasure of placing on the scales one melon exhibited at the fair and seeing it tip the beam at 68 pounds. It was besides an exceptionally fine melon. There were some pumpkins displayed between seven and eight feet around.

The machinery hall was well filled and the large display of

# International Institute of Agriculture at Rome

## Extracts from a Letter Written California Senators by Mr. David Lubin, Formerly at Sacramento and Now at Rome. Mr. Lubin Ably Defends the Work to be Accomplished by the Institute.

SEVEN attacks having been made in Congress on the International Institute which was founded by Mr. David Lubin of this state, he wrote a letter to Senators Flint and Perkins outlining the work of the Institute and the field it expects to cover. From that letter we quote:

"I deem it essential as a preliminary explanation to briefly state how prices of commodities are arrived at. Economists tell us that the law of supply and demand determines the price. But, right here, we must note the difference between manufactured commodities and raw material. The prices of manufactures are largely determined by private sales, whereas the prices of the staples of agriculture are determined by public sales at "wheat pits," "cotton exchanges," "bourses," etc. We are here concerned with the prices of the staples of agriculture, and the question is, How do the exchanges and bourses arrive at the price?

Applying the law of supply and demand, we find that the "demand," so far as the number of consumers is concerned, is fairly manifest, but now let us see how it is with the "supply." Here we are not alone concerned with the stock on hand, but also with the condition of the growing crops.

If the summaries of the supply for the United States—that is, the stock on hand and the condition of the growing crops—were given out only by the operators in the "wheat pits," "cotton exchanges," and "bourses," they would, of course, be given out by interested parties, and would therefore be untrustworthy. Such untrustworthy summaries would give rise to violent fluctuations in prices, endangering not alone the interests of the farmers, but likewise those of the manufacturers, for these products are the raw material of the factories. In other words, they would jeopardize the interests of the capital and labor of the farm and the capital and labor of the factory.

It is for this reason that the United States has built up and now maintains the various bureaus in its Government for the purpose of informing the people at stated periods of the stocks on hand and the condition of the growing crops.

So valuable to the people of the United States is this service that there is now no power which could abolish this source of public information; and, were it abolished, the evils which would follow would be so apparent that its immediate re-establishment would be demanded. Thus it will be seen that the United States Government, by getting out official summaries of the supply, is a factor in the equities of price formation for the staples of agriculture, thereby promoting the welfare of the people of the United States.

The United States is an exporting country of the staples of agriculture. It exports continuously, and the exporters only pay the American producers prices formed in competition with similar products of the other nations of the world. In other words, the exports are sold at the world's price.

But what of the greater quantity remaining for home use? Is this sold at a higher than the world's price by reason of the United States crop-reporting system? How can this be? For the export and the home price are the same, since the exporters and the home buyers buy in the same "pit," "exchange," or "bourse," and at the same time. In other words, all the staples of agriculture in the United States are sold at the world's price.

Now, the question is, "How is the world's price determined?" We stated previously that the "law of supply and demand" determines the price, and that the world's "demand" is fairly manifest. But how does the case stand regarding the knowledge of the world's "supply?"

About this way: Several of the more prominent nations have crop-reporting bureaus which assemble and disseminate the facts regarding the supply in their respective countries, but each of them does so in its own peculiar way. By far the larger number of the nations have no crop-reporting system at all. In those countries the crop reports are gathered by private interests. It is all these sources together which go to make up the various official and unofficial summaries as to the world's supply.

The disseminated summaries are as divergent as are the interests of those who disseminate them.

But is there not a flaw in the logic of the case? In a former paragraph it was stated that the crop-reporting bureau at Washington was performing a task which promoted the welfare of the people of the United States, and now we learn that the United States sells its product at the world's price, and that this world's price is based on the summary of the world's supply, and that this world's summary, whether official or nonofficial is unreliable.

Where, then, do we stand? In this position: The crop-reporting bureau of the United States in a measure benefits the world directly, and the people of the United States indirectly. If the people of the United States are to be fully benefited by their crop-reporting system there must be evolved similar crop-reporting systems in the other countries of the world, for, as Secretary Wilson so pointedly says: "Reports covering part of an area of a given crop may be used by self-interested crop-reporting agencies to mislead." In short, there must be given out at stated periods, and to all the world, an authoritative official world's summary covering the entire area of the crops. Only then will the circuit of information be completed. Only then will the world's supply be known. Only then, when equity in the formation of prices of the staples of agriculture is established, will the United States be fully benefited.

Right here is the need that called into being the International Institute of Agriculture. This is the work it is intended to perform. Its function is to show this need, to get nations to complete their crop-reporting systems, to get them to harmonize the data to the end that the institute may gather from the nations the facts regarding their crops, summarize them, and disseminate them promptly to all the world.

This work the International Institute of Agriculture is instructed to perform by the treaty ratified by forty-eight governments, which is its constitution.

This is the very work had in view by the Department of State in its instructions of September 14, 1908, prepared by the Department of Agriculture and the Department of Commerce and Labor, which outlined "the initial policy of the United States Government in the formative work of the institute."

And now it is in order to deal with the question: "What is the institute doing?" or, as it was expressed in the debate in Congress by Mr. Young, of Michigan: "Does this institution issue a report?" "Does it do any of the work which has been referred to it?"

In reply to the above, I will quote from an official address delivered by the president of the International Institute on May 14 of this year:

The international treaty creating the institute was signed ad referendum by the delegates of the nations on June 7, 1905. The plenipotentiaries of the several governments placed their signatures to said treaty between July, 1905, and June, 1906. * * * The institute was inaugurated on May 23, 1908. * * * The permanent committee has been working since then ceaselessly, but there are many difficulties in the way of founding a new institution, which has the double character of a diplomatic and an economic body. * * *

The institute must obtain an accurate knowledge of the agricultural statistical services in the several countries. * * * It must assemble an inventory of the agricultural resources of the countries and of their average and normal production, which will be of use as a starting point and as a term of comparison for future periodical information

This work the institute has well in hand. There is reason to hope that it will be able to publish within the current year the results of these researches, the importance of which will be obvious to all.

The institute must accomplish another and more difficult task.

It must get all the governments to observe uniformity in the following particulars:

(a) The number and nature of the data supplied by each country for each staple.

(b) The date and mode of stating for each staple, the estimated yield in a percentage ratio of a term of comparison, which should be identical for all the countries.

(c) The interval to be decided on between the getting in of the harvest, the preparation of the statistical reports, and the publication of same.

(d) The indication of amounts by either weight or measure. * * *

The first difficulties have been overcome; the statutes of the institute have been approved; the bureaus are organized; the preliminary studies are accomplished; the work has begun. I hope * * that the institute will be in a position to begin its regular official service in January, 1910.

Before anyone can say that it is not they must show that there is no need for an authoritative world's summary of the staples of agriculture; that, under the present system, and

# Citrus and Sub-Tropical Fruits

## A CALIFORNIAN IN FLORDIA.

AT THE recent meeting of the Lemon Men's Club at Fernando, Mr. J. A. Reid of the Semi Tropic Fruit Exchange gave a short talk on his experiences in Florida from which we quote:

"The Florida growers asked me to come down and explain something of the workings of the California Fruit Exchange. I told them that they had everything to gain and nothing to lose by co-operation, that co-operation had made the Southern California growers what they were. I found in Florida no system of distribution. Some of the big growers there realize higher prices for their products than any grower can in California. These were, of course, the men who had taken the very best of care of their groves. As an average, the better class of growers in Florida are ahead of us in fertilization. Some of them put on 70 to 75 pounds to the tree instead of to the acre as we do here, and get results, and their orchards show the care that has been taken of them.

"Soil conditions there are entirely different from ours here. In fact, all their conditions are different. They have rain at the time we have our dry season. The week before I reached Florida, they had had one of the greatest rains in many years. By the official records it rained 37 inches in forty-eight hours. During the summer it rains nearly every afternoon, and they have frequent thunderstorms. Because their conditions are so different, they can not irrigate as we do. For one reason, their soil is so sandy that it will not hold the water. They usually have a rainfall of 60 or 65 inches. Now they are figuring on trying to put in irrigation plants so that if they get a dry year of only forty inches they can put water on their trees.

"I visited the grove of one man who was installing a $25,000 irrigating plant. Beside every orange tree was placed an upright pipe from which the water could be sprinkled on the tree. It would do them no good to irrigate as we do. The only irrigation they have of vegetable or citrus crops is by something in the shape of pipes that spray the water out in a manner as near as possible to the natural rainfall. This is because the soil is as a rule so very sandy. It is not adapted to lemon growing and they admit it.

"At a fruit stall in Florida I paid ten cents for five little foreign lemons. I asked the Italian dealer if he ever handled California lemons, and he said no, that he had seen California lemons once in New Orleans, but didn't like them because they were decayed. He said that the lemons came from Italy in better condition. It is of the utmost importance that the fruit be picked and packed so that when a man buys it he will buy a box of lemons and not a box of rot. The growers who have been successful are the ones who have taken care in the picking and packing of their fruit so that it arrives in good condition. That is the great secret of the success of those who have made good in the business.

"The country in Florida is largely undeveloped. They have beautiful fresh water lakes and springs although the country is only a little above sea level. Many of the springs are amber colored from the roots of the palmettos. They always speak of their orange orchards there as groves. These groves are of two kinds, those made on hammock lands, and those planted in the sandy pine woods. You will find here and there through the pine woods a little spot of clear land where five or ten or fifteen acres is planted to oranges. This is only in places where the sand is underlaid by a clayey sub-soil. Without this clay sub-soil they could not grow. The hammock land is the low, swampy marsh land. The palmettos are cut out, and leave the richest kind of soil for orchards. This soil produces the quickest and best. Trees there grow more rapidly than ours. They will be as far advanced in three years as the majority of our trees at five years. This is because of the damp warm climate and the abundance of rain.

"Their oranges are now clean except that some are badly infested with white fly. They have had all kinds of scale and have successfully fought them all but the white fly. They have a fungus now that they think will help to destroy it, but have appealed to Congress to let them have an expert to go to South China to investigate as to conditions and methods there in order to find the natural enemy of this pest. They say that the Government was to blame for introducing the fly into Florida and the Government should find the means of destroying it. One great drawback there is that they have so many chinaberry trees which are the natural breeding place of the white fly, and this pest is the greatest multiplier ever heard of. They do a great deal of spraying, spraying three times a year. It generally costs eight, twelve or fifteen cents a tree for spraying and they spray three times a year, so their bill for spraying is no light one. I told them they could get better results from fumigation.

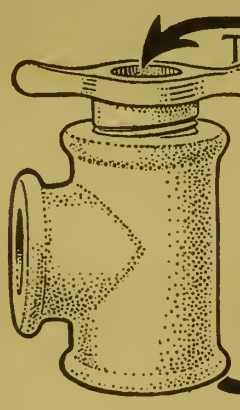
"There are two classes of growers; the old cracker class whose fathers made enough out of their groves to live on—even if they made nothing out of their oranges, they could make a living out of the sweet potatoes that they planted between the rows—and as a rule, they do not have much interest in studying new methods, though some of the younger generation are showing a willingness to take up with the new ways; then there is a large class of Yankees who have come in recently and are putting in business methods and studying conditions. When a grove is sold there, the value is figured, not on the number of acres, but on the number of trees.

"The best growers in the state are to be found as directors and the foremost men in the exchange. The men who came out to Califonia got a little idea of the exchange system in California, but they know nothing of its inside workings or details. They have now signed up fully one-half of the growers of the state on a five year's contract through the Florida Citrus Exchange. They are going to adopt the same methods of distribution now in use in California. While I was there, I learned something of the value of our exchange, particularly in regard to distribution, when I compared our methods with their entire lack of system.

"In conclusion I told the Florida growers that the orange growers of California are interested in them from a business standpoint. In two years Florida has increased its output from three to six and a half million boxes and many young orchards are coming into bearing. If they would organize and properly distribute their fruit, they would get good results, and we could come into the market when they were through with it, and also get good results."

## USING THE SIMPLE ELEMENTS OF PLANT FOOD.

THE WHOLE subject of plant food is a simple one. Air and water contribute the elements which make up the largest percentage of most agricultural plants—other elements, such as calcium, magnesium, iron and sulphur are used by plants in such small amounts and are contained in all ordinary soil in such large amounts, that they are practically never exhausted from the soil. The productive capacity of all soils is measured by the available supply of three elements, nitrogen, phosphorus and potassium. These are the elements which are present in most soils in a comparatively small amount and yet are absolutely required by all agricultural pants in a very considerable quantity. When the soil contains a liberal and well-balanced supply of these three elements, it is called fertile. Every crop removes from the soil large quantities of these ingredients and a continuous cropping will in time, exhaust the most fertile soil. Therefore, the fertility of the soil can only be maintained by preserving good physical



**The Tee Irrigating Valve**

Simple in design and construction, costs less and will last longer than any other on the market.

The Tee Irrigating Valve is made of an ordinary malleable iron T with a brass plug. It is designed for those who want an inexpensive irrigating valve, especially where such valves are needed in large quantities.

There is nothing to get out of order. It is so simple you will wonder why it was never thought of before.

A ½-inch valve sent post paid upon receipt of 40 cents. Quantity price, circular and full information upon request.

When writing advertisers, mention Cultivator.

conditions and by maintaining the supply of nitrogen, phosphoric acid and potash.

**How Secured.**

These ingredients may be purchased: phosphoric acid in the form of ground bone and potash from some of the various salts from the mines in northern Germany. While there are several forms of nitrogen the best and cheapest is nitrate of soda. Nitrate of soda, which resembles coarse salt, comes from South America, and is imported in bags usually weighing 225 pounds. It carries about sixteen per cent of nitrogen and this, in the form of nitrate—the form in which it can be taken up immediately by the growing plant. Carrying as it does, such a high percentage of valuable nitrogen, and that in a form so readily available, puts it at the head of all nitrogen carriers.

Fertilizer manufacturers put out numerous brands which are called "complete fertilizers" because they contain the elements nitrogen, phosphoric acid and potash in various proportions. On account of the difference in requirements of crops in the composition of soils, it is very difficult to make a complete fertilizer. Many of the successful farmers are buying the elements, or "simples" separately and doing home mixing. Many of the so-called fertilizer manufacturers are simply mixers and the farmer can not only save money by buying the "simples" and mixing them himself, but he can compound mixtures exactly in accordance with the requirements of his soil.

**How Applied.**

Much of the profits from the use of commercial plant food depend upon the time and method of application. When planting crops it is desirable to apply the fertilizers before the seed is put in the ground, or at the same time if a drill is used. Grain drills are made with fertilizer attachments, so that both grain and fertilizer may be applied at the same time. Besides these combined drills there are a number of fertilizer drills on the market, which a farmer can use in applying his plant food, some drilling into the ground, another distributing on top. When the last named is used, this should be followed with a light harrow to mix the fertilizer well with the soil. Mixtures of super-phosphate, sulphate of potash and nitrate of soda will feed through almost any make of fertilizer drills.

Because it becomes lumpy and rather moist, some difficulty may be experienced in feeding nitrate of soda alone through a drill and it is then necessary to sow broadcast by hand, after first turning the nitrate out on the floor and breaking the lumps by using the back of a spade or shovel.

Sow a bushel of nitrate to the acre—that's a fair application—for grass, barley, etc. A bucket of 25 pounds will sow a strip 47 feet wide and 233 feet long. When sown on grasses, meadows and wheat, it will have to be used as a top dressing. It is not advisable to sow it when the grass blades are wet with dew or rain, since the nitrate will stick to them and thus do them some injury. In the orchard or vineyard nitrate is a very necessary element since it promotes a growth of new wood and insures healthy and luxuriant foliage.

**It Pays.**

### "PROCESSING" PRUNES.

It is stated that there is considerable diversity of opinion in the Santa Clara valley on the best method to use in drying the prune crop. The "old" methods consisted in taking the prune as soon as it was picked and treating it with a solution of hot water and lye, then rinsing it in cool water and finally placing it in the sun to dry. The "new" method consists of treating the prune with lye, then, without rinsing it off, running the prune over a surface of sharp needles, which make small holes in the skin of the prune, which lets the gas escape while the fruit is drying, thus preventing what is known as "bloating."

In recent seasons there has been a large carry-over of cured fruit every year, and not only this, but prices have sought a very low level.

This has led to cheaper handling methods, and, as necessity is the mother of invention, the pricking-board came as a necessary adjunct in all driers and ranches where prunes were handled in a large way. And now, with the old method of rinsing discarded, complaints have become quite general that our prunes do not carry over as well as they used to.

This fact is well known to all large handlers, but somehow nobody has attempted to discover the reason for the change that has gradually crept over the situation.

Everybody associated with the conditions has had more or less trouble, and every one had a different excuse to offer for the state of affairs. The real cause of the prunes spoiling was discovered only by accident. We happened to buy a carload of prunes treated the old way, which, on account of the abrupt ending of the season, was carried over.

The following year the prunes sold to Eastern parties, and immediately the Eastern buyers wired a duplicate order, thinking that a new car of prunes instead of old fruit had been shipped to them.

This naturally led to a study of the situation, and when a purchase was made during the latter part of the season of prunes actually lye-dipped and rinsed, the fine keeping qualities of the fruit stood out in bold contrast to the fruit prepared by the easier method to such an extent that everybody that saw the fruit became convinced of the inferiority of the new method. Of course, under the new way, where no rinsing is done, the lye is left on the prunes, and the small holes made by the pricking-board allow the juices of the fruit to ooze out, and since lye has a strong affinity for moisture, a crust is formed on the outside of the prunes, and crystals of dried juice and lye render the prunes easy prey to the fermenting evil.

Professor Colby of the University of California has made a microscopic examination of the fruit prepared by the old as well as by the new way, or pricking-board process, and in the written opinion which he has handed in to the Dried Fruit Association of California he strongly advocates that the pricking-board be abandoned and the old lye method resumed, in connection with the rinsing kettle, under an arrangement whereby fresh water can either be kept running or the rinsing vat be emptied frequently, insuring the greatest possible cleanliness. At the same time the water should be kept boiling, so that the prunes would be still hot when they are taken in the sun to dry. This, the professor claims, will prevent what is generally termed bloating, as the flesh directly under the skin of the prune will be cooked. This will make the product uniform and sound, and will do away absolutely with spoiled fruit, except in rare cases where the seed has some ferment in it, which no amount of external preserving can prevent. This feature can be eliminated, however, if the product is properly handled in the beginning.

In a nutshell, the basis of all of our prune trouble lies in the fact that the fruit is not rinsed, and the pricking of the fruit allows the juice to ooze out and cause trouble.

The gas can be let out through the skin if the prunes are properly "chapped" with strong lye, which only cracks the outer skin of the fruit and leaves the inner membrane unhurt; the juices are retained and the prune keeps an indefinite length of time.—San Jose Mercury.

### MAKING CIDER VINEGAR.

When apple juice is left exposed to the air, it is gradually changed, losing its sweet taste and giving off bubbles of gas more or less vigorously. The most prominent change is in the conversion of the sugars into alcohol and carbon dioxide gas. This change is shown as the alcoholic fermentation, and is caused by a vegetable ferment, or an enzyme, which is produced by ordinary yeasts. Cells of the yeast plant are so widely distributed that they get into apple juice abundantly under ordinary conditions.

Theoretically, we should be able to get from 100 parts of apple juice about fifty-one parts of alcohol. In actual practice, we are not able to obtain this amount, because some of the alcohol is lost by evaporation and some is lost by certain chemical changes that take place along with the alcoholic fermentation. In general, we may expect that in the usual fermentation of apple juice, forty-five to forty-seven parts of alcohol will be obtained from 100 parts of the sugars of apple juice.

It may be mentioned that in freshly expressed apple juice, prepared from sound fruit, I have never been able to find any alcohol. Sweet cider is, therefore, a strictly temperance beverage; but, perhaps, not every one could be trusted to tell just where the dividing line is between "sweet" and "hard" cider.

The rapidity of alcoholic fermentation depends largely upon temperature. In ordinary cellar storage, at a temperature of about 50 F., it takes about six months to convert the apple juice sugars entirely into alcohol. At a temperature of 75 to 85 F., this time can be reduced one-half or more. The higher the temperature the more rapid is the fermentation. There is one serious objection, however, to temperatures above 75 F., and that is the loss of alcohol by evaporation. This is favored also by the rapid escape of gas when the fermentation is very vigorous.

After alcoholic fermentation is completed, another change takes place—the alcohol is converted into acetic acid, and the final object of the vinegar maker is the production of acetic acid. This change is brought about through the agency of micro-organisms, called acetic bacteria, these being entirely different from those that change sugars into alcohol.

For the effective conversion of alcohol into acetic acid or of cider into vinegar, there are needed: (1) acetic bacteria; (2) an abundant supply of air, and (3) a temperature of between 65 and 85 F.

There is commonly noticed in vinegar a very elastic, slimy, tough, transparent skin of a yellowish-white color; this skin is commonly known as "mother" of vinegar. This appears to be formed by the growth of the acetic bacteria on the surface of the liquid. When one skin has formed, it settles sooner or later and in its place another is formed, and this formation and replacement continue as long as air is supplied under favorable temperature conditions and as long as unchanged alcohol remains.

The chief change that takes place in the acetic fermentation of alcohol is the taking up of oxygen by alcohol, which is thus changed into acetic acid. Hence air is an absolute essential.

Acetic fermentation as usually conducted by farmers, takes place much more slowly than the alcoholic, often requiring eighteen months, and in some cases two or three years. The most satisfactory results of acetic fermentation have been obtained by us at temperatures between 65 and 75 F.

The following is a practical method of inoculating cider with acetic bacteria. When the alcoholic fermentation has stopped, which, under favorable conditions, should be in one to three months, the cider is placed in barrels, filling half full and then adding one-fourth volume of old vinegar. Mother of vinegar is then prepared as follows and added: Expose in a shallow, uncovered crock or wooden pail a mixture of one-half old vinegar and one-half hard cider at 80 F. In three or four days the surface should be covered with a gelatinous coating, which is "mother" of vinegar. A little of this carefully removed with a wooden spoon or flat stick should be laid gently on the surface of the mixture of cider and vinegar prepared as described above. Do not stir it in, because the acetic ferment grows only on the surface where it can have an abundant air supply. In three or four days the coating should spread itself over the entire surface. This coating should not be broken or disturbed as long as the acetic fermentation is going along satisfactorily. When this method is followed the vinegar should be complete and marketable in one to three months after the alcoholic fermentation is finished.

In this connection we may mention also vinegar-eels, which are so un-

pleasantly common in many home-made vinegars. They are produced by the small flies that infest exposed or decaying fruits. One method of keeping them out is to keep the apple juice from continued exposure. The placing of a loose cotton plug in the bunghole of the barrel in which fermentation takes place effectively keeps out the flies after the juice is barreled. When vinegar is found to be badly infested with eels, the only safe remedy is to heat the vinegar to 185 F., not above this, and strain, cleaning and steaming the barrel before replacing the vinegar and keeping the bungholes closed. Vinegar eels, besides being offensive to consumers, cause the vinegar to deteriorate sooner or later.—New York Exp. Sta. Bulletin.

## OLIVE MILL AT OROVILLE.

In our news notes in issue of Sept. 9th the Cultivator referred to an olive mill to be constructed at Oroville. It seems that Oroville already has one of the finest mills in the country and to correct the item Mr. N. B. Crane, secretary of the Chamber of Commerce of that city writes:

"In your issue of the Cultivator of Sept. 9th in your 'News Notes' of Northern California, I notice the last local in the column reads, 'The olive crop at Oroville, Butte County will be larger than usual this year and efforts are being made to have a large curing plant at which an expert shall be in charge of pickling.' That a false impression may not be entertained by the many readers of your valuable paper I wish to make a correction of the above local, and hope you may find space in which to print it.

"The facts are, that while we are going to have a good crop of olives, and of the best quality, the output will not be as great as in previous years. Butte County is becoming better known each succeeding year as the natural habitat of the olive. The olive district is not confined to Oroville, but throughout the whole county up to an altitude of 2000 feet, and olive oil and pickling plants are in every town and hamlet in the county. Here at Oroville we have the largest olive pickling and oil plant in the United States, if not in the world, as well as other smaller ones. Our olives are pickled ripe, and our pickles and oil have taken gold medals at all the Expositions in the United States, and at Paris, over all European competition. Our ripe Mission olive is considered the finest grown, and at the present time some of the largest pickling and oil plants of Los Angeles obtain their choicest fruit from this section, having many of our largest olive groves under contract, picking the olives and carrying them to Los Angeles in large tanks containing solution, where they are processed and placed on the market as Los Angeles olives.

"I also note in the same column that the Butte County orange crop will be very light. Allow me to correct the item by saying that our crop will be much larger than last year, and of the very choicest quality of fruit."—N. B. Crane, Oroville.

---

A new agricultural empire which is said to rival the great Gunnison project in Colorado has been begun in Colorado. It is proposed to irrigate 125,000 acres of arid land. The contract calls for the expenditure of about five million dollars.

## BY-PRODUCTS OF THE APPLE.

In the present days of science it is entirely wrong for the producers of any of the soil products to allow anything to waste. On the contrary every effort should be put forth to take care of every portion of a crop to the end that the greatest amount of money may be realized from it.

In these days of modern machinery there is so little labor to actually saving every particle of crude product that it would pay every producer to look well into various modes, in use, of producing the popular by-products. Of course it takes a considerable time to acquaint the growers and producers with the many items that they can employ in the making of these valuable by-products and there is room for much to be done along this line.

There is no fruit produced that offers so many inducements to care for the by-products as does the apple. It is exceedingly strange that more growers have not taken advantage of the opportunities that are offered to glean a large reward for their labors. There are so many by-products that will bring a big price that an investigation should be made by every producer.

It is not so much what one makes, but what one saves that makes him rich. The by-product is a saving and therefore the item in the receipts account that is going to make rich apple growers.

## PROPPING APPLE TREES.

It does look a little behind the times to see apple trees propped up as they soon will be in all our irrigated districts. It is the old-fashioned way of growing fruits in this country of heavy yields and even at that the system is all wrong. No one who pretends to be an up to date orchardist has any business propping up his trees. They ought to be so trained and pruned and the crop so thinned that propping is unnecessary. It is a reflection on the care the orchard has received if props are found under the trees.—Field and Farm.

---

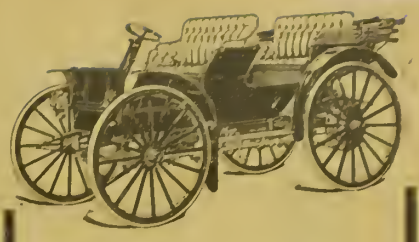
A large pocket knife kept very sharp is a good instrument for carrying while working in the orchard. With it one can cut out small branches and do a vast amount of good pruning that will save much work later. With the big blade of a large, sharp pocket knife a branch nearly an inch in diameter may be easily and quickly cut off. To perform this operation, pull the branch to the tree with one hand and cut with the other. The bending of the branch makes the cutting easy. Let the cut be clean, leaving no stub, or only a very short one.

---

Branches of pear trees that have been killed with blight should be cut out and burned. When they are promptly removed the remainder of the tree not infected will assume vigorous growth and produce a heavy crop of good fruit. A pear tree with more than half of the large branches killed by the blight may be saved in this manner and become a perfect, healthy tree.

---

The Pioneer Fruit Company at Lindsay claims to make the first shipment of citrus fruit from that section this season. The shipment consists of seedless limes, a fruit of comparatively recent introduction.



**Why** Buy the International Auto?

**Because** It saves money in operating expense.

**Because** It avoids 90% of the ordinary automobile troubles with pneumatic tires—no punctures, no blowouts.

**Because** Air cooling does away with a cumbrous water cooling system, and obviates leaking radiators.

**Because** The engine is built for long service and to eliminate repairs.

**Because** Of the many other reasons that we want to tell you of in detail.

# Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## COW TESTING.

By Mrs. M. E. Sherman.

IF YOU are tugging away at the business end of a cow, the idea that there is not a great fortune in the work has come to be fixed in your mind. Dr. Cook has discovered the North Pole and has been able to do this by having a dairy to support the wife and children while he went exploring. Surely, the fact that some one can make money at dairying is demonstrated. Why does the average California dairyman make so little money? Untested cows that are not producing their full share in the herd; further the lack of system in the feeding. If a man is to be paid to do the milking, then it is important that the cows be fed for production. As to the feeding, this must be done according to the markets, one feed may be dear, another may be cheap. I am at present putting in some dried brewers grains for the cows. As the alfalfa hay is short this season these grains will balance up the corn silage to a nicety. They afford as well a cheaper supply of protein than bran.

**Cow Testing.**

The cow testing is best done in the ordinary dairy by having the expert make a monthly trip to the herd. Coming in time for the evening milking and then again in the morning he takes samples, runs them through the Babcock machine, writes the results in the book and the next month does the same. In twelve months, there is a complete record of the cow production. The wages and board of the milker and the amount paid out for feed are added up as expenses. I also add the money paid for insurance and taxes and fifty cents a month for pasture. Divided by the number of cows in milking, the result shows the cost per cow. Then add up the cow's side, giving her credit of $5.00 for her calf to balance the time she is dry. If she pays, keep her, if she does not, sell her if reasonably good, giving her record, as a family cow. This, however, should not be done if she has not produced 225 pounds of butter in the year. If she has not she should go to the butcher as beef.

**Clever Boys.**

The clever boys of a neighborhood could use their Friday afternoons and Saturday mornings for testing and as it is usual to pay $5.00 each time for a string of 30 cows, it would be more profitable than cleaning front yards or cutting grass. Where men regularly follow cow testing as a business they charge 50 cents a cow and the owner furnishes the Babcock machine and the acid. While it may seem useless to those who have not tried it, to test cows, I will be willing to say that not once in ten times can a milker or owner guess the best cow in the herd. They are often very much deceived in the cows, by the flashy milker that shows up well for a few weeks, and then drops away down in her milk. The cow apt to be profitable is the cow standing aside, but pegging away, day after day, at the same good average. It is just the same with people. The one that works a regular number of hours every day, does more work than the one that makes desperate breaks of work up to twelve and one o'clock at night and then lies in bed for a week in the morning to catch up the lost sleep.

**Iowa.**

This State has an appropriation of $20,000 available in the next two years for advancement of dairying. It is thought, some at least, of this money will go to sending an expert around to the dairymen to test cows and train them in the work of keeping the accounts. Some of it will also be spent in work on the crops that are most desirable for the dairyman to grow. The best way to use these crops with the limited amount of labor available, is a problem not as yet touched by the experiment stations.—M. E. Sherman.

## PURE BUTTER CAMPAIGN.

The Pure Butter Protective Association of Pennsylvania is making a campaign against the sale of oleomargarine as butter.

A united and determined effort will be made when Congress convenes, to secure proper remedial legislation. It is a well-known fact that in nearly all sections of the United States, oleomargine is palmed upon unsuspecting consumers, in immense quantities, as and for genuine butter. In other instances, unscrupulous dealers will violate all oleomargarine laws in the most flagrant manner, by ignoring the regulations regarding the selling and marking of packages, coloring of oleomargarine, etc., and it is believed that the time for marked changes in these defective laws has arrived.

The Pennsylvania State and subordinate granges, Pennsylvania Pure Butter Protective Association, Pennsylvania Department of Agriculture, including the Dairy and Food Division, and various other State and County agricultural organizations, unitedly took the initiative steps early last spring to secure these much-needed changes, and a committee representing these various active organizations employed the best legal talent available to formulate a proper National Oleomargarine Act. It is probable that the Honorable Boies Penrose, of Pennsylvania, will introduce the proposed oleomargarine bill in the Senate during the early days of the next session.

The association says:

"This movement does not represent any spirit antagonistic to oleomargarine. Our people do not object to its manufacture and sale by licensed dealers who will sell it as oleomargarine, under legal restrictions; but they strongly protest against its sale as and for genuine butter."

It is recommended that every dairyman personally write his representative and both senators in effect similar to this form:

Senate, Washington, D. C.:

"Dear Sir: Certain Federal laws which govern the manufacture and

sale of oleomargarine should be amended in order that the great dairy interests of the country, as well as consumers, shall be adequately safeguarded from the illegal substitution and sale of this comuodity for genuine butter.

"I am not opposed to the legal manufacture and sale of olcomargarine, but I do object to the sale of this product as and for butter.

"I earnestly request that you will assist, by your vote and influence, at the coming session of the 61st Congress, in securing remedial legislation which will properly protect dairymen, farmers, merchants and consumers from the fraudulent traffic in oleomargarine and other substitutes for pure butter."

Also that Granges, dairy associations and other organizations authorize the sending of a letter similar to the following to President Taft.

"We learn from the report issued by officials of the Pennsylvania Department of Agriculture, Pure Butter Protective Association of Pennsylvania, and the Pennsylvania State Grange, that the National Laws which control the manufacture and sale of oleomargarine are defective in many particulars. That by reason of these defective statutes, unscrupulous dealers sell illegally great quantities of oleomargarine as genuine butter. Such traffic is a serious detriment to dairymen, and an injury and deception to consumers. Statistics of the Pennsylvania Department of Agriculture show that about 90 per cent. of the oleomargarine retailed is sold as pure butter. We strongly object to the sale of this commodity as and for butter."

"It is also rumored that Hon. Franklin MacVeagh, Secretary of the Treasury Department, is inimical to the great dairy interests of the United States by his attitude in recommending a decrease of the tax on colored oleomargarine as provided by the terms of the "Grout" law.

"Therefore, we, on behalf of the dairymen, farmers, merchants and consumers, generally, earnestly protest against such action as it is alleged Mr. MacVeagh proposes to take at the next regular session of the 61st. Congress.

"We would respectfully petition that in your message to Congress on the occasion of its convening in December next, that you invite special attention to this important subject, and suggest proper remedial legislation to properly safeguard our dairy interests and protect consumers from the fraudulent sale of oleomargarine for butter."

**Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.**

## TULARE COUNTY FAIR.

(Continued from Cover.)

engines, water lifting machinery and steam fittings made by the Smith-Booth-Usher Co. of Los Angeles won for that concern the blue ribbon for the most complete exhibit in the machinery department.

The poultry and dairy exhibits were large and the substantial buildings housed them most attractively. The dairy industry is next to fruit growing the strongest factor in the upbuilding of the Tulare section. In the dairy exhibit, in the two year old Holstein class, the blue ribbon was given to W. F. Mitchell and second place to R. F. Guerin. In the butter fat contest, premiums were divided between A. W. Smith and C. G. McFarland of Tulare. Mr. McFarland's cow, Gertrude Grimm, a Jersey, won the blue ribbon. Mr. Guerin's Apple Blossom Zampa, a Holstein, took second place. We show on this page an engraving of Mr. Grimm's Holstein that took first place in the butter fat contest last year.

R. F. Guerin's Prize Winner.

The fair was given a good attendance from the very first evening when it was formally opened by an address by Secretary of State Curry, at which time almost every exhibit was in position and ready for inspection. The fair was a most complete success as showing the possibilities of Tulare county agriculture and was of great value in bringing together the producers of that section in closer bond.—D. C. M.

## CONCRETE SILOS.

Excavate loose and yielding soil to solid ground and of large enough diameter to allow for the thickness of the walls. Then construct a twenty-inch solid wall up to the ground level with a mixture of concrete as follows: One part Portland cement, three parts sand, five parts crushed stone. See that this foundation is well tamped and you are now ready to construct forms for silos, which are to be constructed as follows:

Draw a circle the circumference of the foundation; then lay boards on the line around the circle. Nail these lightly together, then using the same form of measurement, mark a circle upon them; knock apart and saw as marked. When nailed together again, you have what is called the "By-Form" or brace.

After constructing several of these forms, which are to act as the inside braces, erect forms four feet high, by nailing side boards on this brace, using the next one when needed. Allow for three-inch hollow wall and 10-inch air chamber, concrete to be mixed as follows: One part cement, 3 parts sand, 4½ parts crushed stone; tamp well. Allow this concrete to set hard; then wet top of wall and raise forms for the next filling of concrete. Be sure the forms overlap the wall by about 3 inches; then fill as previously instructed and so on until desired height is reached.

Reinforcing to be as follows; one-forth-inch steel bar placed around the outside of the wall and centered every three feet. Set these bars before concrete is poured into the forms. They can either be set with wooden blocks or wire. For an absolutely water-proof silo, wash the outside with pure cement.

The roof can be made of concrete, or of wood, allowing for ventilator at the top.

Openings should be left for doors every four feet. A shute should be constructed as follows: Of rough boards construct a form, running simultaneously with the side of the silo so as to form a perfect bond; the size of the chute to be three inches thick, three feet at the sides and 4½ feet on the face, reinforced with bars running from top to bottom.

It would be advisable where there is an abundance of alkali water for the farmer to secure a slag cement.—Farm Stock and Home.

The state of Colorado has received $50,000 from the net receipts of the national forests within the bounds of that state for the year ending July 1st, 1909.

# The Thing That Interests Dairymen Today

is not which Company **has made the most failures** in its attempts to make successful Cream Separators, or which Company has abandoned or discarded the most inventions because (by its own admissions) of the inferiority of those inventions.

***The questions which interest dairymen are:***

## Which is the best Cream Separator in 1909?

## And which will continue to be the best Separator in 1910?

The **United States Separator holds the World's Record** for close skimming.

Its record has not been equaled by any Cream Separator, although numerous attempts have been made to equal it.

The **United States** has a **solid one piece frame.** No bolts, screws or rivets to work loose.

Gearing enclosed in dust-proof case. Gearing runs in oil bath.
Closest skimmer in the world. Simple and easy to clean.
Light running. Longest life.

The **United States** has the best point of all—**perfect separation**—and also has **more other good points** than any other Separator.

## HOW TO USE A HOE.

So many people have a horror of using a shoe. It is the mist comfortable implement found in the equipment of a gardener or farmer, and it is handy to use for so many purposes that one cannot get along without it.

Probably one reason that people do not like like the hoe is that most hoes explain at once how "dull as a hoe" came into proverbal use.

A dull hoe is certainly not a pleasant implement with which to work. The good gardener will keep his favorite hoe filed to a sharp edge all the time. It is impossible to grind a hoe on a grindstone because the bevel must be on the upper side of the blade when it is in use, in order to make the hoe "bite" into the soil.

File your hoe, making the bevel about twice as wide as the thickness of the blade. Then keep it bright and when you go out after weeds the hoe slips through the soil so easily that hoeing is not much like hard work.

Champion Market Melon.

In hoeing, a long slow movement should be made, if the soil is in good condition. Simply "scuffing" half an inch of the top soil is enough to kill weeds and one can go over a lot of ground in one day if the hoe is sharp and bright and the strokes long and smooth.

With a sharp hoe one can cut thistles, dock, dandelions and other noxious weeds with quickness, dispatch and ease. It is light to handle, easy to use and more effective than any other implement for many purposes.

In choosing a hoe, select one the blade of which lies, not quite flat on the floor when you are standing erect, with the hoe handle extending from your hands when in working position to the floor. The heel of the hoe should not quite touch the floor from this position.

Such a hoe will bite into the soil easily, when it is bright and sharp and will work smoothly and effectively.

Sharpen the hoe as soon as it gets noticeably dull. This will be hard on the hoe but it saves muscle and hoes are cheap.—Farm World.

## ONION GROWING.

The onion thrives best in a cool, moist soil which is easily kept in a mellow condition. Such soils are confined mostly to river bottoms, and they contain more vegetable matter and sand than is commonly found in mesa and upland soils. Large amounts of decayed vegetable matter seem to be essential to the best development of this crop.

Heavy soils are not suitable for ounion growing, for the reason that it is difficult to make a good seed bed, and the surface is likely to bake and crack, much to the injury of the young plants. It is difficult to get a uniform growth of onions on such soils, consequently a large percent of scullions usually results.

The land for onions should be heavily fertilized with well-rotted stable manure. It is then put in the very best condition possible for planting.

Cultivation and weeding is begun by hand as soon as the plants appear above the ground. The hand wheel hoe is used, but the thinning and some of the weeding must be done by hand.

If good onion soil has been selected, but little irrigation will be needed in the fore part of the season. In the heavier soils, where the water is run in furrows between double rows, the irrigation is begun earlier, and every effort is exerted to keep the ground moist.

Harvesting is begun by the 15th of September and the crop is usually all out of the field by the middle of October. The bulbs are pulled by hand and thrown into windrows. After they have become completely cured, the tops are removed, and the onions are sorted and sacked. Topping is done by cutting off the tops about a half-inch above the bulb, taking care to make a smooth cut so as not to injure the outer coverings.

## SOME EXPERIENCE WITH EUCALYPTUS.

In response to a number of requests for further information as to eucalyptus for moist land, A. E. R., Latou, contributes the following:

"Five years ago I obtained some eucalyptus trees from a neighbor—about 800, paying fifty cents per hundred. He had grown them in his garden the previous year. He placed two boards on edge a little less than four feet apart, and sowed the seed in rows in the bed thus formed. The boards used were 1x12 sixteen feet long. Lath were then placed across the boards, leaving a space the width of a lath between each two, nailing a strip across the ends for convenience in handling them, making four sections each four feet square. The lath were used to protect the young seedlings from the sun. The plants came up very thickly. When about six inches high, they were transplanted in the open about two inches apart.

The trees which I bought to plant averaged about fifteen inches high and were scarcely as large as a lead pencil.

There were about 400 red gums (rostrata) and as many blue gums (globulus). I planted them in rows eight feet apart, setting them two to three feet apart in the row, simply sticking a spade in the ground, pushing it forward and dropping the tree behind the spade—a very poor way to plant—yet a majority of the rostrata grew. Not many of the blue gums survived such treatment.

My land is Kings River bottom land under the levee. It has never been cultivated except a little the first year. The water rises to the surface in a season of high water in the river. Frosts and wet feet killed all the blue gums but one, and that one has made slow growth.

I commenced cutting posts when the trees were four years old, getting two seven foot posts from a tree, one good post, the other smaller. The branches and leaves make excellent kindling. The posts are very strong.

## GROWING PLANTS FROM SEEDS.

THE growing of plants from seed is one of the most enjoyable forms of gardening, far surpassing in interest the planting of advanced plants from the florists, which are ready to transfer to the ground, and have no claim on one's affection and sympathy, as must be the case with anything which we have cared for during a period of some weeks and watched grow from a tiny seedling—just cracking the earth above its head to peep and see what all the light and air and sunshine above ground are like, through the first true leaves and successive transplantings, until we triumphantly exhibit the matured plant, strong, many leaved and giving promise of abundant bloom or fruitage, when a little time and sunshine shall have had their way with it.

Seeds may be planted in the shallow boxes, known as flats. These may be of any convenient size, but should be shallow, not more than three inches deep for such plants as asters, verbenas and the like, while for tender green house plants and those of fine seed and slow development at the start, as the begonias, nicotianas and the like, the shallow cigar boxes are preferable, as they are easily handled and afford sufficient room for one variety of seed. They should have a few small holes drilled in the bottom for drainage, these being covered with a bit of glass or crockery, to prevent the earth washing into them and clogging them up.

The best earth for fine seeds is fine leaf mould and a little clean, white sand. For the larger flats and coarser seeds, a good garden loam, well incorporated with leaf mould and sand, may be used.

Sow such fine seeds merely over the surface, pressing them into the earth with a bit of board, set the flats in a pan of water until the surface looks dark, but not wet, drain off all surplus water and place in a warm place where the flat will have bottom heat, if possible, and an even temperature; cover the flat with a sheet of white paper and a pane of glass and leave until germination takes place, watching the flats in the mean time, to guard against drying out of excessive moisture.

Larger seeds should be covered lightly with fine earth or sand sifted evenly over them, and pressed down with the board. While still larger seeds as asters, pansies and the like, may be sown in drills one eighth of an inch deep, and the earth brought over them and firmed.

Large seeds of ornamental plants, as the cannas, ricinus and the like, where it is desired to sell them, may be planted singly in small thumb pots and shifted into larger ones, as the pots fill with roots. These should find ready sale about planting-time among one's neighbors.

Should the small flats show a tendency to dry out at the bottom, set them in a pan of water as at first, draining away all surplus moisture. If too wet, which will be shown by drops of water on the glass, remove the glass partially until the right degree of humidity is restored. Do not pour water from a cup or watering pot on flats of seed, but water with a rubber sprinkler or, if that is not at hand, a brush broom dipped in water and shaken gently over them. —Orffs.

## GARDEN NOTES.

The lawn that is patchy should be reseeded and the seed raked in with a hand rake. Covering the seed lightly with soil from the creek bottom will insure better germination and growth.

Shrubbery and perennial plants well arranged on the home grounds add wonderfully to the character of the home. A great part of life in summer is lived out of doors, hence it pays to make the resting grounds about the dwelling as sanitary and as attractive as possible. Ornamental plants add large money value to a place.

Set out a few flower and fruit plants each year and soon you will have an abundance. Many people never have any yard and garden worth speaking of because they always neglect to order and set out plants in season, always fully believing that they will not forget it the next year. A good motto in gardening is, "Do it now."

More than 11,000 named roses are now found in the catalogues and possibly one-half of these are in fairly common cultivation. Yet, still more surprising is this that a dozen well-selected, very distinct varieties will represent the most important colors, shapes and seasons of bloom. In Europe, where practically all the roses worth growing were first raised the rose gardens are planted with varieties belonging to a much-mixed group called the hybrid perpetuals so named because they bloom without intermission from June until cold weather. In this country the name is unfortunate because with very few exceptions the hybrid perpetuals obstinately refuse to be perpetual in any sense of the word. They give one crop of glorious blooms in June, then serenely suspend operations for a year. Because of this condition the majority of the whole class of hybrid perpetuals has fallen into disrepute but at least a good round dozen of first-class varieties will flower more or less throughout the season.—Field and Farm.

## CARE OF THE HOME LAWN.

Those who delight in a good lawn must observe these facts: Regulate the frequency of your mowing by the appearance of the grass. Aim to keep it looking green and velvety. It will not have such a look if you keep it shaved too closely in hot weather. It is a big mistake to clip a lawn too close. A sward that has the appearance of being shaved with a razor cannot be ornamental. There must be enough of the grass blade left to give the dark, rich color and the plush-like effect upon which all lawns depend for their attractiveness. A closely-clipped lawn always shows the brown of the decaying leaves at the base of the plants, through its green, thus robbing the sward of the velvety look which is its most pleasing feature.

**Genasco Ready Roofing**

Trinidad Lake asphalt is the backbone of Genasco. It is the greatest weather-resister known. It makes Genasco cost a little more, and makes it worth it because it lasts so long.

When you don't have leaks, damage, repairs, and renewals to pay for, you have real roof-economy.

Get Genasco—the worth while roofing for every building on the farm. Look for the hemisphere trade-mark, and you'll get the roofing backed by a thirty-two-million-dollar guarantee. Mineral and smooth surface. Write for samples and the Good Roof Guide Book.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 334, 335.

## The Year Book of 1908.

THE YEAR BOOK of the Department of Agriculture for the year 1908 is received. In size and general appearance it is very similar to those that have preceded it for several years.

For nearly half a century the "Agricultural Report" appeared every year until the name became so firmly fixed in the public mind that it is still current though fourteen years have elapsed since Congress substituted the Yearbook for the old Report. In fact, Congressmen still speak of their stocks of "Agricultural Reports," which about the Capitol and Government Printing Office are familiarly known as "Ags.," and thousands of farmers every year write for "Agricultural Reports" when it is the Yearbook they want, and that is what they get. It is true there is still an "Annual Report of the Department of Agriculture," but it contains merely—to quote the law— "the purely business and executive matter which it is necessary for the Secretary to submit to the President and Congress." Only a small edition of this report is printed.

The Yearbook, on the other hand, must "contain such reports from the different divisions and Bureaus and such papers prepared by their special agents, accompanied by suitable illustrations, as shall be specially suited to interest and instruct the farmers of the country." The Yearbook must also "include a general report of the operations of the Department." Besides these there is an appendix which includes the organization of the Department; a directory of the leading farmers' organizations, agricultural colleges, experiment stations, etc.; a brief review of the weather conditions prevailing in all parts of the country during the year; an account of the prevalence of insect pests and fungous diseases; a report of the progress made in soil survey work, in forestry, and along other important lines; and last, though by no means least, a very complete collection of the latest reliable statistics of crops, animal products, exports, imports, etc.

This book may be obtained without cost by application to the representative of the district in which you live or to one of the state senators. The Department is not granted a sufficient number of them to supply them direct, so readers of the Cultivator who wish to secure a copy should at once make application. It is well worth having, and Cultivator readers should secure their quota. It may also be secured of the Division of Publications of the Department of Agriculture, but in that case a charge of $1.25 is made.

## Producer to Consumer.

THE producer who goes into the city retail market to buy what he may himself have sold a day or two before, is staggered at the price put upon it. There is a vast gulf between it and the price he received.

In illustrating this point, Senator Flint in his Pomona speech said, referring to the suit of clothes he wore, the material in his suit, woolen, trimmings, buttons, thread, and everything complete, did not cost to exceed $5.80. The labor of manufacture, which, as we all know, is nominal, and the profits of the wholesailer and retailer, added to this $5.80 until he was compelled to pay $25 for it. Hosiery, for which a slight advance had been asked and for which the women of this country signed unnumbered petitions to have put on the free list, costs complete on the dock at New York $1.15 per dozen. This is the ordinary hosiery which commands $3.00 per dozen at retail. Few women wear $75 French bonnets, and those who heard Senator Flint's scathing arraignment of women who would pay that amount for a bonnet, probably never will on the street at least. But taking a $75 French bonnet as a basis, Senator Flint showed that the exact cost of all its parts amounted to $5.60. Of course the French design, the reputation of French make, and especially the profit to the retailer, made the difference.

The prune grower today is compelled to be satisfied with three cents a pound, but it is a very ordinary prune indeed that does not cost in any city 15 cents a pound to the consumer. The wholesaler, the retailer, and the packer certainly have taken their share from those prunes.

We believe the time will come when there will not be this difference. How it will be brought about, we are not prepared to say, but this is a problem to which thinking people of this country may well devote a little attention.

## Power of Organization.

UNITED STATES Senator Flint in his address at Pomona last Monday, speaking of the one-half cent increase on the lemon tariff, gave great credit for securing it to the power behind the organization of the California Fruit Growers Exchange. He said that without that organization and the fund of information it furnished, the hands of those who wished well to California would have been tied, and the importers and their agents, who so persistently worked for reduction of the citrus tariff, would have won the day.

This may be a gentle reminder to fruit growers along other lines of the advantages which would accrue to their industries were they organized and working together not only to secure immediate sale of the product in hand, but their best interests along all lines.

## Fight Fires.

IF THERE is any place in the world where the ounce of prevention is worth all the cures that may be applied, it is in the matter of forest fires. From every part of the state come reports of vast damage from fires which sweep with uncontrollable force over field and hill side. The cause of these fires is seldom given, but when it is, "embers of camp fire carelessly left" or "cigarette carelessly thrown," or similar reason, is the explantation of the cause.

It is possibly true that interested parties at times maliciously cause these fires. For such there is no punishment sufficient, and they should be unrelentingly prosecuted. We believe the proportion of such fires is exceedngly small in comparison with those caused by carelessness, and that a campaign of education should be taken up in every part of the state. The trouble has been that reputable people who "didn't think" left the live embers which caused the trouble. Their friends naturally shield them and the great wrong to the state goes unpunished.

Our laws are very rigid; let all citizens join in enforcing them. Any camper who leaves the live embers of his camp fire should be reported at once to the proper authorities. If this plan is followed, it will prove so irksome to the careless ones, and the word will be passed along so quickly that the problem will be simplified and the "cure will not have to be applied.

## International Institute of Agriculture.

(Continued from Page 315.)

without the institute, the American producers and consumers are sufficiently guided by the information they now have, information not alone of the crops of the United States but of the world. Can that be shown?

In a football game between contesting teams would it be considered fair to have the game umpired by a member playing in one of the contesting teams? Yet that is precisely what is done in the great business of the agricultural industry. The farmers produce, and the buyers have all the say as to what the price shall be, and this price is based upon the total of the world's supply, which total they furnish. And we know what that price will be, from that rare economist of old, who said: "'It is nought, it is nought,' saith the buyer, but when he hath bought, he goeth his way boasting."

This would be humorous indeed if the evils of the present system were not so dangerously far-reaching. There was a time when this evil was feebly organized, but in our day of colossal combinations; of gigantic organizations of capital, cunning, and craft; of mastership in the employment of these powerful agencies, is it safe to leave this power for evil in the hands of interested parties?

We increase our army, we augment our navy, all for the sake of conserving the nation; but what good can our army do, of what value our navy, so long as a few rich, powerful, and crafty organizers may determine the factor which goes to make the price of our staples of agriculture? Here the very foundation of the structure upon which this nation rests is within easy tampering reach of an enemy infinitely more difficult to perceive, to control, to overcome than all the foreign powers of the world. And who can deny this? It can not be denied. It is true.

Since this is true, what is to be done? Can any one suggest an alternative other than making the governments themselves the umpires? Can any one find a more effective plan than that the world's summary be supplied by the united efforts of the governments of the world? And the redeeming effect of such a united effort is one of the evidences clearly showing that the safety of the nations is dependent upon international cooperation and amity.

In this united effort it becomes the duty of each of the adhering nations to take its stand as a master, a leader, guiding and directing the institute in its work; each of the nations as master and the institute as servant. These masters must not merely act the part of quiescent onlookers, but that of directors, guiding the labors of the institute, in order that it may adequately perform the task which has been intrusted to it."

# Agricultural News Notes of the Pacific Coast

## Northern California

Nearly 700 cars of grapes passed through Sacramento last week.

A co-operative fruit company has been formed at Roseville, Placer county.

The big winery at Geyserville has already crushed more than 500 tons of grapes.

The levees near Willows, Glenn county, will be improved by the expenditure of $22,500.

Experts who have examined the rice from the fields in Butte county report a high grade of product.

Alfalfa growers near Yuba City, Sutter county, report an exceptionally fine crop of alfalfa seed.

Yellow jackets at Jackson, Amador county, made such a savage attack on a cow and calf that both died.

A severe north wind at Woodland, Yolo county, injured the crop of pears and French prunes to a certain extent.

A big forest fire started near Stirling City, Butte county, and swept over many miles of valuable timber land.

Sacramento Valley Beet Sugar Co. is running about 600 tons daily of eighteen to twenty-three per cent beets.

The Tokay grape crop of Biggs, Butte county, is proving of fine quality and much larger than was anticipated.

Vacaville, Solano county, has shipped to date this year 941 cars of fruit, almost a hundred cars more than last year.

Farmers of Modoc county have combined and pooled their wheat holdings at a price ten cents in advance of any offer yet made. Their price is $1.65 a hundred.

Sacramento Valley beet growers have been so perplexed with troubles with Japanese laborers in the beet fields that an effort will be made to secure white labor for the future.

A Chico almond grower is gathering a large crop of almonds by using a funnel shaped sheet underneath the trees which runs the nuts into a box at the center as fast as they are knocked off.

Farmers at Redding, Shasta county, who are members of the Shasta County Farmers Protective Association are gathering data to use in their fight against the smelters which they assert are ruining agricultural conditions.

The board of regents of the state university have opened bids for the construction of horticultural and veterinary buildings on the university farm at Davis. The horticultural building will cost not far from $20,000 and the veterinary building $7000 or $8000.

A corporation has been formed, and articles filed in Solano county, with capital of a half million dollars for the purpose of obtaining land and planting hardwood eucalypts. The big Gilde Ranch of several thousand acres in the northern part of Solano county has been purchased.

## Central California

San Jose horsemen will construct a race track.

Hanford is shipping quantities of pumpkin flour to Arizona points.

Over 150 acres of land were burned over in Santa Cruz county last week.

A large crowd gathered at the recent opening of the Lodi Cooperative Winery.

The Tulare County Fair closed last Saturday night with a remarkably successful season.

Lemon growers of Tulare county are in arms over the increase in the lemon freight tariff.

Producers and manufacturers of food products recently held a pure food exposition at San Jose.

The Suburban Land and Water Co., at Bakersfield, will subdivide a quantity of orange and lemon land.

A representative of the Argentine Republic is investigating fruit growing conditions of the Pajaro Valley.

Figures compiled by Mr. George Robertson of Fresno show that imports of raisins are vastly increasing.

Tree planters of Monterey county will plant thousands of acres in that section to eucalyptus the coming season.

The state creamery operators convention will be held at Porterville for three days beginning November 18th.

Supervisors of Monterey and San Benito counties propose the building of a new road over the San Juan mountains.

Stockmen near Kerman have figured that dried wine grapes are worth fourteen dollars per ton as stock food.

Brush burned from the hills in Eastern Fresno county is said to have greatly increased the feed possibilities for the stockmen.

Three car loads of Pajaro Valley Newtown Pippins have been shipped to London for exhibition purposes at the Earl's Court Exposition.

Fresno county peaches at the close of the season are reported to be of exceptionally high grade. Practically all canning fruit has now been put up.

Fresno raisin growers are contemplating making an exhibit at the United States Land and Irrigation Exposition which will begin in Chicago, November 20th.

At the recent annual meeting of the Tulare County Fruit Exchange V. D. Knupp was elected president, G. S. Berry, vice-president, and W. E. Sprott, secretary and manager.

The big Miller & Lux Company has begun work on the extension of the old Kern Water Company's canal near Bakersfield. This will reclaim much land which has heretofore been flooded in time of storm.

The Santa Clara Co. Grape Growers in session recently passed resolutions asking managers of the Portola festival in San Francisco to recognize and use only products of the California vineyards in the various functions of the festival.

## Southern California

Cucamonga growers are receiving $15 per green ton for their peaches.

One Oxnard, Ventura county, bean grower reports a bean vine having 365 pods.

The lima bean output of this state is expected to reach a million and a quarter bags this year.

It is estimated that over 5000 visitors attended the grape festival at Escondido Admission Day.

Fullerton's citrus growers are going after the mealy bug which is becoming a pest in that section.

The apple crop of the Yucaipe Valley will bring growers of that section over $100,000 this season.

Redlands orange packing houses are being overhauled and will begin the coming season better fitted than ever.

The total cost of the reclamation work expected to be taken up in the neighborhood of Santa Maria is about $130,000.

A Garden Grove rancher has taken up the production of peppermint and has found a three acre field of it to produce exceedingly well.

At the recent meeting of the directors of the Brawley Creamery Co. it was decided to raise the full amount of the capital stock.

Apricot growers of Ventura county have been much encouraged by this season's returns and a new impetus has been given to the industry.

The Orange County Carnival of Products is being held in Santa Ana today. One of the strong features is an exhibit by the poultry fanciers.

Ventura county bean growers are now in the midst of the bean cutting campaign, the season being earlier than anticipated on account of the recent warm weather.

The Ontario Citrus Association elected the following directors at its recent annual: G. W. Russell, H. E. Swan, J. A. Clark, A. T. Hamilton, Hugh Latimer, W. H. Lindley and B. E. Williams.

The farmers union and the Imperial Valley Business Men's Protective Association join in sending representatives of the valley to a meeting of the state railroad commission in San Bernardino this week.

Forest fires in the Cleveland forest reserve extending down into San Diego county back of Escondido are said to have covered a range of land over twenty miles long. One human life and many head of stock were lost.

The fruit packing season at Pomona Cannery has closed with over two million cans of apricots, berries and peaches put up. To this time there have been nearly 60 carloads of fruit shipped from this one cannery.

At the lemon men's banquet in Los Angeles last week the feeling was freely expressed that the fifteen cents per hundred raise in the lemon freight tariff would lead to the passage by Congress of an act giving more power to the Interstate Commerce Commission.

## The Coast

Corvallis ships 22 carloads of cured prunes this season.

Cut worms are doing immense damage in Gardnerville, Nevada.

Five hundred fowls were exhibited at the Interstate Fair at Spokane.

The Senate Irrigation Committee will visit Yuma, Arizona, on November 12th.

Oregon hop men maintain that a price of 25 cents will yet be reached this season.

Fruit growers at Grand Valley, Colo., recently observed their annual "Fruit Day."

The Interstate Fair at Spokane, Wash., paid this year over $100,000 in premiums and prizes.

The farmers union warehouses at Pullman, Wash., are nearly filled with wheat of this season's crop.

The Northern Pacific Railway has reduced the freight tariff on wheat twelve and a half per cent.

One farmer at Roasalie, Wash., reports a hundred bushels per acre average of oats on 110 acres.

One dealer recently purchased 450 bales of 1908 hops at Portland at the reported price of seventeen cents.

An agricultural demonstration train along the Wyoming line of the Chicago Northwestern will start early in October.

The Utah State Agricultural College made material improvements in its buildings prior to the opening of the fall term.

A new feature will be introduced at the Interstate Fair at Spokane this year in what is called the work horse parade.

A New York fruit buyer has bought the entire new crop of the Hood River apple district, paying $2.50 per box.

Large flouring mills and other interests in Portland were recently consumed by fire, entailing the loss of a half million dollars.

The Portland Union Stock Yards were opened on September 15th and are said to mark an epoch in the livestock industry of the Northwest.

The great wheat harvest of the Palouse country, Washington, is over and shows exceptionally big yield, with big warehouses and grain buyers as yet unable to handle the entire amount.

The original livestock buildings at the A-Y-P Exposition being too small, they were nearly doubled before the opening of the stock show which was on September 27th. Over 250 exhibitors are represented.

Irrigationists in Oregon have been assured that the reclamation service will continue irrigation development in that state. The state claims that there is due to it from the service over two million dollars.

The Wenatchee Valley Fruit Growers Association sold its entire output of apples to one buying syndicate at the following figures: Spitzenbergs, $2.50; Winesaps, $2.25; Black Bens, $1.75; Jonathans, $1.75; Missouri Pippins, $1.50.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

## FOR MOULTING HENS

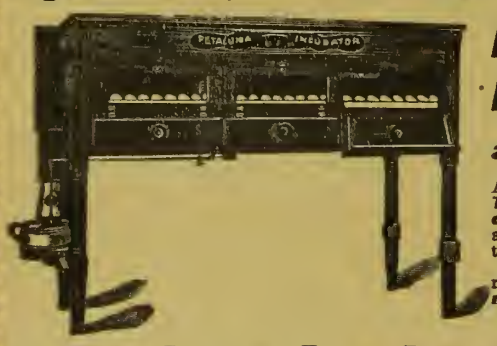
**Feed**

# MIDLAND

## Poultry Food No. 4

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.



## Petaluma Incubators and Brooders

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

## SUCCESS

Right from the start, that's what we guarantee you with the Defender line of chick machinery. It's just the equipment you should have to make the most money raising poultry, will insure you greater success because they are made right, and of California Redwood, strong, substantial, simple and economical in operation, smoke proof, soot proof, fireproof and insurable, automatic control of heat, perfect ventilation, moisture or no moisture, has deep and warm nursery. Don't buy until you investigate why our machines are superior. GUARANTEED TO HATCH A LARGER PERCENTAGE OF STRONGER AND MORE VIGOROUS CHICKS THAN ANY OTHER INCUBATOR, and the kind of chicks that grow up and bring a profit that tells. Remember WE PAY THE FREIGHT, and can save you half the cost. Our 540-egg size something less than $34.50. SOLD ON 30 OR 60 DAYS FREE TRIAL, and your money back if not satisfactory. Send for free catalogue D. and get on our mailing list, so that you may get the free poultry lectures that we will start mailing Jan. 1st.

**Defender Incubator Co.,** Dept. D. Livermore California

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

## THIRTY-FOURTH ANNUAL MEETING OF THE A. P. A.

By Mrs. Frank Metcalf.

THE thirty-fourth annual meeting of the American Poultry Association held at Niagra Falls August 7-12 was a "rouser." More members were present than at any previous convention ever held. Between 160 and 170 members were there to answer to roll-call, and the interest was great.

The word had somehow gotten around that some sensational disclosures would be made, and the action of the Executive Board in expelling two members: Ross C. Hallock and Edward T. DeGraff fulfilled the verdict of the knowing ones, and surprised many.

Hallock was alleged to have been guilty of flagrant disobedience to the rules and regulations governing the conduct of officers while in office, and DeGraff had been accused of "faking birds, and exhibiting birds belonging to others." He admitted the charges and didn't seem to think he had done wrong, but the Executive Board thought differently, therefore expelled him from membership, and suspended his alleged partner, Geo. Tracy, for one year. Following this action, DeGraff was also expelled from membership in the R. I. Red Club.

He seemed not to realize his position and rose with the rest when the New York delegation responded to roll-call, and President Bryant immediately stopped proceedings until he was removed from the room. Thus, doubly disgraced, he left the convention, and what further action he may take is uncertain.

That a new era is beginning to dawn, is proven by the action of the Executive Board in this matter. Dishonest methods of doing business will meet with prompt punishment hereafter, and a member of the American Poultry Association must conduct himself as becomes a man and a gentleman, or suffer the consequences. This will eventually result in weeding out undesirables, and a membership in the association will stand for a certificate of good character, a long step upwards.

No less than 195 new members were enrolled during the past year, and the affairs of the Association are generally in good shape. Some financial embarrassment arises from the fact of having $6,000 tied up in the bank of Beaver, Pa., where it was placed by the late T. E. Orr before his death, and the certificate of deposit never having been found since. The money is there, and belongs to the A. P. A. but the bank refuses to pay it without certain forms being gone through, which will insure it against loss in case the lost certificate should ever be found.

The offices of secretary and treasurer were separated after much discussion, the secretary to have a salary, the treasurer only office expenses.

The revision of the Standard occupied most of the time and was the most important work on hand. The Standard for 1910-1915 will be an improvement upon the present Stardard in some essentials, but the changes are not so radical as we were led to expect from sensational reports.

White Laced Red Cornish fowls were admitted to the Standard, but the Cornish fowls were not placed in the English class, as was requested, and are still orientals. Had a representative been on the spot to work for this change it is the opinion of many that it might have been made, as there is nothing that tells on a convention like a real, live, "Johnny on the spot" to prove a living witness to the interest taken in the proposed amendment.

Buckeyes were not dropped from the Standard because two members of the National Red Feather Club were there to prove that the interest in this breed is increasing healthiliy and the club growing in power and efficiency at a comparatively rapid rate. E. L. Andrews, Ithaca, N. Y., and Eugene Cowles of Shelbyville, Ky., represented the interests of the Buckeyes well.

New breeds asking for admission to the Standard, had not fulfilled the requirements, and could not be accepted, as follows: Partridge Plymouth Rocks, Columbian Plymouth Rocks, Single Comb Silver Spangled Hamburgs, Pit Games, Buff Orpington Ducks, Bourbon Red Turkeys and Buff-booted White Bantams. I. K. Felch sent in a protest against the admission of the first three named varieties on the ground that they were simply single comb sports of the older types, and not distinct breeds.

A new feature of the new Standard will be a glossary of color terms, a difficult task for the committee in charge.

It was decided to select a new meeting place for the next convention, and St. Loius is striving strenuously for the honor, promising 100 new members if she gains the day.

The visiting ladies were well entertained, by courtesy of the Reliable Poultry Journal through Mr. and Mrs. Grant M. Curtis, who tendered a delightful banquet and automobile ride to all ladies in attendance, both of which were well attended and heartily enjoyed.

Although Niagara has been a delightful meeting place for three years it is rather too far east for good western representation, and a move west at least as far as Chicago would mean a whole lot to the great and growing West. The choice will be voted upon by mail, and we wouldn't be at all sorry to have it as far west as Denver, if not clear to the coast.—Mrs. Frank Metcalf.

## POULTRY QUERIES.

**Melon Seeds.**

Will melon seeds harm poultry? We have been eating a good many melons this summer, and throwing the rinds and seeds to the chickens. Now some of the chickens seem to be so weak that they fall over. Is there anything I can do for those that are sick? They will eat anything, and seem ravenously hungry. Aside from their falling over, one would not know that anything is the matter with them. They have been running in a vineyard. Would they be likely to get anything there that would injure them?—E. S., Pomona.

I am sure I throw out all the melon rinds and seeds to my chickens, just as you are doing, and see no bad results whatever. Perhaps your chickens may be overcome by the heat, sort of a sunstroke, or may be they get overripe grapes. I have seen chickens and turkeys under the influence of fermented fruit and they wobble just like a drunken man, and fall over, only to get up and look foolish. If none of them die, I should not bother about their bad habits, as the grapes will be gone before long, and their "spree" will be at an end.

Now, I may be entirely wrong in my conjecture, but from the rather meager details, I should suspect that this is the trouble.

If I knew how many chickens you have, what and how much you feed them, and whether there could be lice or mites at the bottom of the mischief, I might diagnose the case differently, but your own good sense will correct any trouble resulting from under-feeding, or vermin. All I can say is the above, unless a too confined diet of new wheat may have caused leg weakness as it sometimes will, even with birds on free range.—Mrs. F. M.

### Best House.

Some years ago I saw plans in the Cultivator for a hen house made with ventilation at the bottom, each end, below the roots. The house was entirely closed at the top, no ventilation at all. This was for the individual house, of course. Do you know of anyone who is making a success of poultry using that kind of house? I find the poultrymen here using the long houses each side of the alley way, vents at top of roof, no battens on side of house, and the houses appear to me to be full of draughts. This is quite a windy valley, but hens appear to be healthy. The claim for this style of house is that it is cheaper to build, and less work to care for hens, and makes the work easier in rainy weather.

I would like to get your idea of the very best up-to-date plan for a house that can be used for 50 to 500 hens. I am not after the cheapest, nor the ones that make the least work, but one that will be best for the hens. There are a number of rainy days up here in the winter time. In an individual house for 50 hens, suppose an open scratching shed could be used. I wish to thank you for the many helpful articles in the Cultivator.—W. C. H., Santa Cruz.

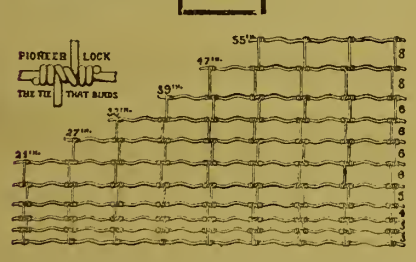
I believe the house referred to above, did not "pan out well" upon trial. Am under the impression that the foul, hot air from the hens would arise towards the roof, where it could not escape, making a regular "sweat-box" of a place. The principle was, that the foul air, being heavier, would sink and be carried away, but the fact was, that the foul air was heated by the bird's body temperature, and being warmer than the air from beneath, naturally rose up for the fowls to breathe over again, thus causing disease.

Now, to open these houses at the roof, was to invite strong air currents, which would not better conditions, therefore the open front scratching sheds are a very great improvement upon this style of house. The open front house may be made singly, or in a long house, divided into compartments. It may be made very cheaply and simply, or one can elaborate and use extra good material and have it as costly as one cares to. By the use of a dropping board, a two story house may be built, increasing the floor space, and by having a second floor about two feet above the ground, the floor space can be doubled, and the birds kept happy and contented in rainy weather, if given plenty of sand or straw to work in. The main thing is to have the three tightly closed sides, so there will be no draughts of wind blowing on the fowls.

This two and a half story house is the kind in operation on the Pacific Poultry Co. plant, a new plant in Southern California. The lower floor space is on the ground level, with the soil removed and eight inches of sea sand shoveled in every six months for the birds to wallow in, this being all the yard they have. The floor space above is the scratching and laying room, and the dropping boards are still above this, extending half way. The whole length opens at the back with a big door, which is made perfectly tight, so no draughts can get in from this source, and the front is wire netting, as is also the front under the floor. The partitions are also of the wire mesh. The partitions between the roosting places are made of heavy duck, so there will be no breezes blowing from end to end, and the houses are 500 feet long containing 100 pens 5x8 feet, each pen to hold ten hens and a male. The roof is given a long pitch towards the front, and a short pitch towards the back, thus giving extra height for the roosting place. It looks like birds in a cage to one accustomed to large runs or free range, but suits the man who built it, and his egg yield seems to bear out his assertion that he makes it pay.

According to experiment station work in various parts of the country, 50 hens is too many to do well in a flock, and better results were claimed where the number of hens did not exceed 15. In trial after trial, the egg yield fell off in proportion to the number added over and above 15, so while it means more work to keep them in smaller flocks, if it pays it surely should be done.

**Kokomo Hog Field Poultry Fence**



The Standard of all makes. Square and Diamond Mesh Fences for all purposes. Made of heavy, non-rust, self-regulating steel wires. Absolutely hog tight and stock proof. Write us for catalog and prices.

**Have You Tried**

**Coulson's**

**No 3 Condition Powders for Poultry?**

A first-class tonic and conditioner like ***Coulson's No. 3 Condition Powder*** is of great benefit to the chickens, especially when used at this time of year.

***Coulson's No. 3 Condition Powders*** will prevent diseases, by keeping the flock in a thoroughly healthy condition. By the same means it will keep them laying longer into the molt, and their healthy condition will enable them to molt quickly and commence laying at an early date. As it contains no injurious stimulant, it can be used with perfect safety at all times and for this reason is fed in large quantities by numerous poultrymen.

**It Contains No Cheap Filler**

In buying a bucket or sack, therefore, every pound is of value to the chickens, and will give you large returns for the money invested.

For sale by all dealers or at factory.

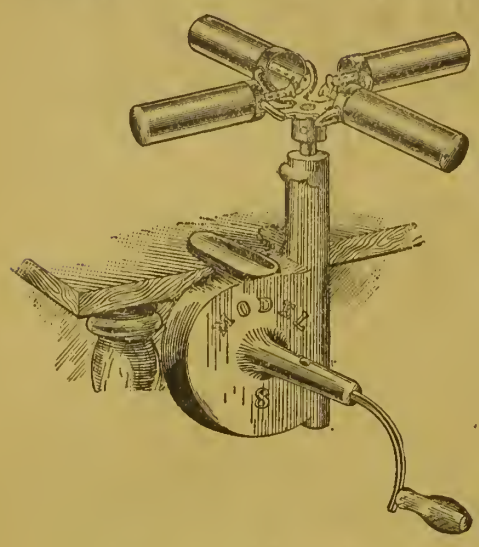
# Improved Babcock Tester



Babcock Milk Tester, an extremely simple, light, compact and carefully designed apparatus, especially adapted for use in the dairy and also on account of its light weight to the Traveling Dairy Inspector.

The working parts are entirely enclosed in a handsome cast-iron case, and consist of but two cut gears, namely, bronze spiral gear and steel spindle with worm thread.

The Tester is fitted with swinging pockets and malleable iron head; it turns very easily without any vibration or jar and can be readily attached for operation to any table or bench. The bottles are perfectly horizontal when rotating.

| | wt. lbs. | |

# Irrigation and Forestry

## THE EUCALYPTUS FOR AFFORESTATION AND REFORESTATION.

By Leonard Coates, Morganhill.

THE EUCALYPT has been for a great many years, and must continue to be, the most useful tree for the afforestation of treeless plains under certain climatic conditions. These conditions, so far as the United States is concerned, exist only in California, with the exception of portions of Arizona and New Mexico, where some species are being grown. Some Eucalypts would grow luxuriantly in Florida for a period, and then be killed by the frosts that occasionally sweep over that state. In California, while the growth of these trees is exceedingly rapid, the

Eucalyptus Urnigera.

cool nights, and the gradual lowering of the temperature in the fall, so harden them that they are not affected by frosts which otherwise might prove injurious.

In Algeria, even bordering on the Sahara Desert, the Eucalypt, planted in groves and avenues, has become so common and characteristic a feature, that the traveller would at once conclude that it was a tree indigenous to that land, which is, apparently, the conception of some present day writers and novelists. And yet the species was unknown in Northern Africa a little over fifty years ago.

And what of the great plain or valley of the San Joaquin River, California? What changes will the Eucalypt there bring about fifty, twenty, or ten years hence? "Quien Sabe."

The Hon. James Bryce, in his "Impressions of the South Africa", says: "The want of forests in South Africa is one of the greatest misfortunes of the country, for it makes timber costly. Unfortunately, most of the South African trees grow slowly, so where planting has been attempted it is mostly foreign sorts that are tried. Among these, the first place belongs to the Australian gums, because they shoot up faster than any others. One finds them now everywhere, mostly in rows or groups around a house or hamlet, but sometimes also in regular plantations. * * * If this goes on, the Australian immigrants will sensibly affect the aspect of the country, just as they have affected that of the Riviera in Southeastern France, of the Campagna of Rome, of the rolling tops of the Nilghiri hills in South India."

The species that in California have been most thoroughly tested and approved for this purpose in the hot, interior valleys are Eucalyptus rostrata, E. tereticornis, E. viminalis, and E. rudis.

### Reforestation.

There is less of an element of romance as this part of the subject is approached. There is also proportionately less risk, less "gamble," with, possibly, smaller or slower return, where the Coast range of oak or other timber lands are re-planted with Eucalypts, than where a hitherto treeless plain is converted into a forest. In these lands, readily available at low prices, a much larger assortment of Eucalyptus trees may be successfully grown, owing to the milder climate and more humid atmosphere. Amongst these are E. corynocalyx, E. resinifera, E. maculata E. pilularis, E. diversicolor, E. cornuta, etc.

Groves of Eucalypts, and avenues leading to farm residences, were planted years ago in the Santa Cruz mountains, and, where old enough, they have seeded themselves, thousands of young seedlings being seen sprouting among the decaying leaves, loose soil, and in the natural forest conditions that there prevail.

Where practicable, even these lands should be plowed, or cut up with the disc harrow. To get good returns from a Eucalyptus grove it is always necessary to see that the soil is right, and that growth is stimulated by cultivation for a time. But the expense is trivial compared with any other crop.

The U. S. Dept. of Agriculture issued a "Circular" on Eucalypts which it deemed incorrect, as it was followed very shortly by a "Revised Circular." This might well be "revised" again. Estimates given on board feet per acre could only have been computed from plantations on poor lands. Anyone can demonstrate accordingly by visiting the region from Palo Alto, to Burlingame in San Mateo county. Even the "Sutro Forest," planted some thirty years ago by Adolph Sutro on the drifting sand dunes southwest of San Francisco tells the true story. And this is not the "forest condition" alluded to, but bare sand, where hardly a thistle or a Burbank cactus would grow.

The people, who pay these men, are getting rather weary of sulphur rulings, whereby clean, properly sulphured fruit is condemned, and also of hurried, careless statements, palpably incorrect, and proving not only incompetency, but prejudiced misstatements in much of the "information" published, and which should be of great use were it more carefully compiled.

# General Agriculture

## FARMERS UNION.

REPLYING to a letter from Gridley as to the origin and aims of the farmers union, a writer in the central office at Fresno says:

"We are not in position to say what the Farmers Union is in other states. We have reports of some of the work being done by it in other states, but nothing that can be confirmed. We can say, however, that the farmers union is doing fine work in the San Joaquin and the Santa Clara Valleys, and is fast becoming a power in the business world.

"We have shipped some 800 cars of watermelons so far this season from this valley, representing from $50,000 to $60,000, and we are sending our returns daily to the growers for these goods. The price the growers are receiving for their melons this year is better than usual, despite the fact that the amount of melons produced this year is nearly four times that of previous years. We are shipping melons as far east as Colorado and Montana and as far north as Calgary, B. C., and to all outside points in this state.

"We have shipped about 90 cars of green fruit to date to the auction markets in Chicago and New York. These 90 cars of fruit represent $100,000 to the growers of this valley. We have also made some f. o. b. sales that netted the growers $30.00 per ton for peaches, which is much in excess of previous years.

"The honey producers of this valley are having their honey handled through the farmers union and have signed up about eight cars of honey with us. The honey men of Imperial Valley also want us to handle their honey and are being organized that they may ship their honey through us

"A sweet potato pool is being formed in Merced and Stanislaus counties, which will represent about 300 cars, and they have asked that they be handled through the farmers union. A butter fat pool is also being formed in these counties which will be operated through the union.

"We seem to have the entire confidence of the people in this part of the state. As to the matter of handling the dried fruit and raisins signed up to us this season, we have eight packing houses in readiness in this valley and four in the Santa Clara Valley, which will be operated by the California farmers union.

"There are approximately three million members of the union in the 27 states. About 5000 warehouses, elevators and packing plants for meat and lard are being put in rapidly. Something over 48,000 farmers belong to our organization in California. Each member pays ten cents per month in dues or thirty cents per quarter. One-third of this goes to the national secretary-treasurer, one-third to the county union, and one-third is kept at home."

## SHRINKAGE OF GRAIN IN DRYING.

An excessive amount of moisture in corn is the principal cause for its deterioration during storage. The amount of moisture is therefore one of the chief points considered in grading corn, especially for export. In the effort to find an accurate and practical method of determining the amount of moisture in grain, the U. S. Department of Agriculture two or three years ago devised an apparatus by means of which the moisture can be accurately shown in from 20 to 25 minutes. In using this apparatus the amount of moisture is expressed in percentages of the original weight of the grain. For instance, one sample of corn may have only 11 per cent. of moisture, while another may have 35 per cent. Naturally the drier grain is worth more than the other, other things being equal.

But since this apparatus has been put into use disputes between grain merchants on one side and elevator men and operators of grain driers on the other have become more pronounced. The trouble is that the percentage of moisture shown by test before storage or before drying does not correspond with the actual loss of weight which results from storing or from drying. There is no real difficulty in this fact; it is a simple matter of arithmetic.

Suppose a certain sample of grain weighs 100 ounces, and the moisture in it is 20 per cent. or 20 ounces. Now, suppose the grain is dried until it weighs only 90 ounces. That means that 10 ounces of moisture have evaporated, leaving 10 ounces of moisture still in the 90 ounces of grain. The grain has lost 10 per cent. of weight, but the percentage of moisture has been reduced only 8.9 per cent, because 10 ounces is 11.1 per cent. of 90 ounces. It therefore seems as if the shrinkage in weight has been greater than the reduction in the percentage of moisture.

# Malthoid Roofing

Mr. W. T. Somes, Proprietor of Bimini Hot Springs Hotel, Los Angeles, Cal., U. S. A., writes as follows: "Our hotel building, a flat roofed structure covered with Malthoid Roofing, is situated quite near the large Bimini Bath Houses that burned so fiercely the night of November 15th. The wind carried the blazing shingles and red hot cinders in showers to my building, where they simmered on the Malthoid Roofing and went out, doing no damage beyond a numher of small blisters raised on the surface of the roofing. We have had one rain since the fire and the roof is tight."

**The Paraffine Paint Co.** No. 34 First Street San Francisco, Cal.

E. G. Judah, General Representative, Security Bldg, Los Angeles

**Pioneer ROOFING**

We tell you to put on a "Pioneer Roof," and forget it. Needs no paint or repairs. Sun proof and rain proof. Not affected by extremes of heat or cold. Suitable for all kinds of buildings—pitched or flat roofs. Comes in handy rolls. Easy to lay—anybody can do it—no special tools needed.

Now then—Let us send you samples, a copy of our 32-page Roofing Booklet and name of our nearest agent.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Guernseys.

Please tell me where I can secure herd of registered Guernsey cattle.—W. A. F., Laton.

The only breeder of Guernseys in California to whom we can refer you at this moment is the J. M. C. Marble Co. of Los Angeles, which has large ranches in the Antelope Valley. They may be addressed at the H. W. Hellman Bldg., Cor. 4th and Spring Sts., Los Angeles.

### Direct Connection with Centrifugal.

Will it do to make direct connection between marine gas engine and centrifugal pump at a distance of two feet? If so, what size of two cycle engine will be best for a three inch pump?—M. D., Lodi.

The direct connection which you suggest will be effective. The size of engine required will depend entirely upon the lift; it may be a one horse or twenty-five horse power. In a general way it may be said that for a three-inch centrifugal pump .114 horse power is required for each foot of lift. From this it would seem that for a fifty foot lift a six horse power engine will do the work; for a hundred foot lift, a twelve horse power, and so on.

### Government Land.

The Cultivator recently made the statement that the Yuma Indian Reservation was soon to be thrown open to entry. This item of news was taken from an exchange the name of which we do not now recall. Inquiry at the U. S. Land Office in Los Angeles discloses the fact that while this reservation will be opened, no immediate instructions have yet been received from the reclamation office at Washington, so nothing can as yet be said as to when filings may be made. The Cultivator will keep in touch with the matter and will give definite news to our patrons.

### Asbestos.

I have a couple of claims on asbestos rock land. Can you inform me what the rock is worth? Would like to know if it would pay me to work it.—W. W. H., Yuma.

Asbestos is a valuable mineral and sells in the East at from fifteen to twenty-three dollars per ton according to the length of the fiber. A very long fiber even brings prices far in excess of twenty-three dollars. The long fibre, however, is very scarce. The best plan for you would be to send samples of the rock to the Philip Carey Mfg. Co., Cincinnati, O., from whom definite information can be obtained as to its value.

### Trimming Blackberries.

What is a good way to trim blackberries? We have been in the habit of cutting out the canes that have borne as soon as possible after the fruit season is over, and trimming back the new growth to keep the new vines from growing too tall. They generally bloom scatteringly through the fall and most of the winter, and, consequently, have a light crop the next spring.—Mrs. E. S., Pomona.

You ask a difficult question. I have had more or less to do with the blackberry in California for more than twenty years and I don't think I know half as much about how to prune them to get the best crop every season, as I did when I first came. The method you have been using frequently results just as you state and some seasons will give an abundant crop. I am speaking now of the Crandall's Early as it is the only variety I have grown. There is one method that I found excellent and it seemed to do away with the light yield through the latter end of the season. As soon as the main crop is off, cut off everything even with the ground and clean up and cultivate lightly. In a few days the shoots will begin to come out of the crown, when you want to select four or five of the strongest and keep all others cut out. Do not prune those you have left until February, when they should be topped back to three feet and the laterals to about one foot. This will give you a clean vigorous growth of wood that will produce a good crop the following season.—Q. A. L.

### Transplanting Palms.

When is the best time to lift date palms, California fan palms and B. Edulis? Those I wish to transplant are about two and a half feet high and have had no water all summer.—J. V., Livermore.

As they are practically dormant from this time until spring it will be safer to allow them to stand where they are until the approach of the growing season—say April. Many nurseryman take them up in the fall and pot or box them and set under the protection of the lath house or burlap sheds, where they recover from the shock of transplanting and are ready to start into active growth in the spring. In moving them, cut off most of the leaves. This is not so essential if you can ball them well—that is remove them to their new quarters with a good ball of earth attached.—Q. A. L.

### Teats Attached.

Two teats of Jersey heifer have grown together for three-fourths of their length. Can they be parted satisfactorily?—Old Subscriber, Ontario.

Yes, if the teats are perfectly formed, it will be successful. If the teats are joined very far down and the cutting will make large wounds, the operation had best be delayed until the teats have grown to full size, or they may be deformed by the scars and made lopsided and hard to milk.—M. E. S.

### Dipping Tents.

Please give method of treating fumigating tents by the cactus process.—E. B., Escondido.

Mr. Pease of the Horticultural Commission of San Bernardino county writes:

In reply to your query about dipping fumigation tents will say that we do not use the cactus dip or mineral paint solution and have not done so for a number of years for the reason that we have found a more satisfactory formula for the purpose which is oak extract. We have a tank over a furnace. The tank is 3 by 3 by 10 feet. Into this, filled two thirds with water, we put enough oak extract to make the tents quite dark brown. Bring it to the boiling point, then immerse the tent for thirty minutes. Draw up on a derrick that stands over the vat and after draining spread out to dry. The oak extract prevents mildew and partially fills the cloth thus making the tents last longer. Nothing but oil will make the tents gas tight and that makes the tents too heavy.

**Wire Stretcher and Hoist**
**$1.90** Express Prepaid
Money refunded if not satisfactory. Just the thing for stretching wire and butchering hogs and calves. It lifts and pulls anything. Automatically grips the rope at any point. Order today and send for catalogue of wire fences.

# Bees

## HIVES AND SUPERS.

The hive, or brood box can be home-made, with loose bottoms, which can be removed for the purpose of cleaning out possible obstructions such as dead bees, says a writer in Farm, Stock and Home. The top must be made of pattern slats or boards, spaced to fit sections, so as to keep the queen bee from crawling up into the super. These slats and sections can be bought of some bee supply house very cheaply. These sections should be placed in a box snugly, and so proportioned that 2 tiers, 48 sections, will fill the box level full and without any spaces except those in the sections. Get sections with two open sides and to match the slats they are to be placed on. Such a super can be made of 1-inch ends and ½-inch, or less, sides, but the bottom must be made of pattern slats to fit those on top of the brood box. For a covering of the sections a piece of oil cloth, cut to fit, will be found as efficient as boards.

The sides must be so nailed or screwed on that they can be easily removed when the sections of honey are wanted. The outside covering or shell of the super can be made of the cheapest grade of galvanized iron, nailed around the proper size of a board for a top, and flared out at the bottom so as to fit tight over the brood box. Lift this cover off only when you want to attend to samething about the super, and don't make the bees uneasy by your omnipresence or curiosity.

The sections should be started with foundation comb. Cut foundation into 2-inch squares and cut again diagonally across the square. Melt over lamp chimney in a tin basin, a small quantity of rosin and beeswax, dip each triangular piece of foundation comb edgeways into this warm mixture and stick in upper corner of section. This process is important, can be done very rapidly, even by the amateur, and it helps the bees in the architectural phase of honey production, to get things straight.

When buying bees get them in hives, and perhaps with patent supers, so you will need extra boxes only for the new swarms. If the purse doesn't object to buying all the bee supplies get the kind you got your bees in first and everything is made after patterns to fit. These supplies are cheap if you nail them up yourself.

## WHEN A QUEEN BEE IS LOST.

It is very important to be able to learn at once when the queen is lost during early Summer. The loss of a queen from a hive, even for a single day, will make a marked difference in the strength of the colony, for a good queen will lay 2000 to 3000 eggs in a day at this season. Whatever you do, be careful and not drop the queen off the combs when handling them at this time of year, and do not interfere with her work by changing combs about to expose brood.

By a little attention you may be able to detect a queenless hive by the manner in which the bees act on the outside. When they stand around in a care-for-nothing manner and no bees are going in with pollen, it would be well to open the hive and take a look at them. If you find eggs and worker brood you may be quite sure the queen is there; if not, go ahead and find out if there is no queen. Finding none, proceed at once to take a frame of brood from another hive and watch if they start queen cells in about 24 hours. If not, then they have been some time queenless, and if such is the case give them a queen if possible.

# Classified Liners

Rates 1½ cents per word per issue No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

## MISCELLANEOUS.

THE ANCHOR EGG SEPARATOR works perfectly; no well regulated hotel or household can afford to be without it." So says Delmonico's Chef. Send ten cents or ten names of persons keeping poultry, and we will send one postpaid. Or for 25 names we will also send postpaid "THE POULTRY MANUAL" by those high authorities, F. L. Sewell and Ida R. Tilson, profusely illustrated. WEST COAST MILL CO., 705-709 So. Griffin Ave., Los Angeles, Cal.

### THE FLYWHEEL AND THE FLY.

A Fly lit on a Flywheel and was
startled when he found
That the Flywheel was going round
and round.
So he held his legs akimbo, chuckling
airly with glee,
"Why, the thing that makes the Fly-
wheel go is nothing else but
me!"

The Fly he rode the Flywheel for a
little hour or so,
And buzzed in his excitement as he
murmured, "Watch us go!"
"Pray, what other Fly could set a
wheel a-spinning like a top?
For if I should leave this Flywheel,
it certainly would stop."

The Fly retained tenanciously his
airy little notion,
Till by and by he felt himself grow
dizzy with the motion.
So he tumbled, but he noticed as he
lit upon the floor
That the wheel was going round just
as it had before.

O little Fly, O naughty Fly, 'tis pite-
ous to feel
That your legs are not the motor pow-
er that spins the awful wheel;
And certainly 'tis a shocking and em-
barrassing surprise,
When facts like these grow obvious
to Men as well as Flies.

### PRELIMINARY TALK.

"SAY, papa," Bobby began. "Now er—you know what you said once."

Bobby's father laid down his paper and frowned thoughtfully.

"Was it something unusually brilliant?" he asked. "Or was it just one of my everyday remarks?"

"It was about my passing at school."

"It did look somewhat doubtful," his father said solemnly. "I hoped at first that you would make it, but I'm willing to make allowances, so if you didn't get through—"

"Oh, but I did!"

"Good! Let me congratulate you!"

They shook hands formally and then Bobby settled back in the big chair.

"It was an awful lot of work," he said. "Specially hist'ry. Gee, there ain't nobody but Mamie Kelly can remember half that stuff. Susie Herrick got 27 for her mark, but she ain't going up anyhow and she says she don't care. Oh, I bet she does all right!"

"Of course she does."

"Anyhow, I'm glad she ain't going to be in my room next year. She's the limit. Billy says she's the stingiest girl he ever seen. She never gives even a girl a bite when she's got an apple and then she thinks we're fierce if we don't let her have some of ours I'm glad she didn't pass."

"Here, young man, don't talk that way."

'Well, I don't care. I am glad. All the fellers are sore at her. Now, Nellie Foster passed all right. I thought at first she didn't, 'cause I seen her sitting in a corner crying. I ast her what's the matter and she said she was sorry for Susie Herrick. Say, wouldn't that make you laugh?"

"Nellie Foster seems to be the right sort, Bobby—"

"Oh, sure she is. I gave her my Taft button and she stopped crying. It's busted some, but she can glue it. I told her I was glad she'd be in my room next year."

"That was handsome of you."

"Well, anyhow, I'm glad it's summer. I s'pose you'll go on your fishing trip now?"

"Not for awhile yet, but I have made all my arrangements."

"Say, papa, when you cast do you throw this way or twist your hand crooked like this?"

Bobby stood with his feet planted squarely and his arms waving in imminent danger of smashing the lamp.

"Get my rod from the corner, and I'll show you," said his father.

Bobby brought the rod almost reverently and placed it in his father's hands.

"It's harder than it looks," he sighed when the lesson was over. "I don't believe I could hardly ever catch a thing."

"You'd like camping," his father said slowly. "The sky and the trees and the lapping of the water. I don't believe you'd mind the hard parts, either—the flies and mosquitoes and getting wet and tired."

"You bet I wouldn't!" Bobby cried, eagerly. "When I'm a man I'll go every year."

"Your mother's going to a hotel where you can play tennis and I'll come up later on."

"I don't know how to play tennis."

"You don't know how to fish, either," his father said. "I've engaged a real Indian to cook for me and be guide and he has a canoe."

'Oh, papa!"

Bobby was silent a long minute and then he spoke hesitatingly.

"You said—" he began.

"Yes?"

"You said if I passed you'd see that I had a lot of fun this summer and I don't call it a circus to go up to that crazy hotel."

"Why do you talk that way?"

"Well, I don't call that fun. Gee, you got to stay so awful clean and the lake never gets even rough enough to be fun swimming in it. It's a regular girls' place."

"Would you rather stay at home?"

"I should say not. All the fellers are going somewhere."

'Where do you want to go?"

"Camping!"

"In the cold and the rain? And walk miles and miles when it's steaming hot? And be wakened at night by owls and raccoons and hedgehogs and snakes? You aren't very big yet, you know."

"I'm bigger'n Billy," Bobby cried, indignantly. "I could use your fish-pole easy if I wan't afraid of busting it."

His father regarded him thoughtfully.

"We won't put it to the test," he said. "I'd rather not have it broken. Suppose, instead, you bring me that small new one from behind the davenport and see how it works."—Chicago Daily News.

### EXERCISE FOR BETTER FIGURE.

An excellent exercise for reducing abdominal fat is taken as follows: Lie flat on floor with arms at side. Catch the toes under something to hold the feet down. Keeping the knees stiff, take a deep breath and rise slowly to a sitting posture. Lower the body slowly, expelling the breath. But care must be taken not to overstrain the muscles while practicing these movements.

## LAUNDERING CURTAINS.

LACE and muslin curtains may easily be laundered at home, and that without any great expenditure of time or trouble if the matter is gone about in a scientific manner.

A dry, mild day should be chosen for the operation. First shake the curtains before wetting, or hang them up and brush them dry with a soft brush to get rid of the superfluous dust. Then soak in cold water and borax—one tablespoonful to two gallons of water—for an hour or two. This will remve all traces of old starch and will facilitate matters greatly.

Squeeze them well in the water, then pass through a wringing machine. Wringing by hand tears the delicate fibers. Wash in warm water, making a lather with soap jelly. Work them up and down in this, squeezing and pulling them through the hands. If not clean after the first washing, repeat the process.

### Don't Rub.

Rubbing of all kinds must be avoided and it is always dangerous to wash curtains by machinery. Rinse them in the usual way, first in warm water, then in plenty of cold, to insure perfect cleanliness and a good color. Pure white curtains may have a little blue either added to the last rinsing water or mixed in with the starch.

The curtains may then be dried, but a great saving of trouble will be effected if they are starched right off. In this case the starch will be required to be a little thicker than if the drying process is first resorted to.

Hot water or boiled starch must always be used and the requisite thickness will soon be learned by experience.

All being ready, enough starch to thoroughly wet one only should be put into a basin or small tub. Squeeze the curtain as dry as possible. Empty the basin and put in fresh starch for the next. The reason for this is obvious, for if the curtains are wrung out, the one after the other, the starch will gradually get thinner.

### Dry Quickly.

The curtains ought to be dried quickly. Hang them over a clothes line exactly in halves, following the pattern along the center, peg quite evenly and securely, and then draw the scalloped edges out carefully and see that they hang right opposite to one another. Given a good drying day, half an hour or an hour, at most, will be sufficient time to leave them on the line.

They should be gently pulled into exact shape, folded into quarters, putting the scalloped edges neatly together, and run through a mangle. They are now ready to be hung and will look like new.

Mangles are most useful and as we always use one, perhaps a few words on how to care for a machine may prove helpful. Apply a few drops of oil to each bearing every time the machine is used. The rollers must be dry when in use. When through with the machine release the pressure from the rolls by loosening the springs. When not in use cover the mangle with a blanket, or some other covering to keep dust from the machine.

When mangling the clothes take them from the line while damp or just before they are quite dry, and fold them straight without wrinkles. Do not sprinkle quite as much as for regular ironing, if the clothes are dry. Leave them folded for a couple of hours, so that the dampness will become even.

After mangling put the goods on a clothes rack or similar article to dry before they are packed away. Large pieces, such as tablecloths and sheets should be folded twice with the hems at the ends and fed into the machine straight and lengthways, care being taken that they do not wrinkle in going through the machine.

Bring them back through the machine and fold in the middle, putting them through and back again. They should be folded to the size desired. Small pieces, such as napkins and towels, may be mangled first flat and put through the machine again at each fold until folded to the size desired.

If lace curtains have had an accident or are worn in holes, do not attempt to darn them. A much better plan is to cut a piece the required size from an old curtain, dip it in starch, then press it over the rent with a hot iron. The defective part will thus be invisibly mended until next washing day.

### Muslin Curtains.

Muslin curtains are a little more troublesome to do up than lace, inasmuch as they require to be ironed. The washing should be done the same as the lace, but the rinsing operation must be very carefully performed.

After blueing them it is a good plan to rinse them again in clean, cold water. This gives them a beautifully clear color, not at all suggestive of the blue bag.

Should the curtains be at all inclined to be yellow, or if they are very much soiled, they may be allowed to stand for twenty-four hours in cold water to bleach.

The starching must be carefully attended to and after the curtain is squeezed out of the starch, it should again be dipped into fresh clear water, squeezed and well clapped between the hands before it is dried. This removes all extraneous particles of starch and preserves the clear and semi-transparent look on which their beauty depends.

After the curtains are taken from the clothes line they should be very carefully folded, rolled tightly, and left for three or four hours before ironing. It will be understood that they are not left on the line to get bone dry and hard, but just dry enough for ironing.

---

## TO KILL FLIES.

The London "Lancet," the leading medical journal of the world, says that the best and simplest fly-killer is a weak solution of formaldehyde in water (two teaspoonfuls to the pint). Place in plates or saucers throughout the house. Ten cents worth of formaldehyde will last an ordinary family all summer. It has no offensive smell, is fatal to disease organisms, and is practically non-poisonous except to insects.

Pyrethrum powder, which may be bought at any drug store, burned in the house will also kill the flies.

---

## HE KNEW.

Tommy—"Pop, what is meant by circumstances over which we have no control?"

Tommy's Pop—"Modern children, my son."

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point!"

MORE LIGHT

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

THE ANGLE LAMP

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

# San Francisco and Los Angeles Produce Markets

## Los Angeles Markets

LOS ANGELES, Sept. 29, 1909.

### Butter.

Butter has taken another advance and now stands at 70 cents for extras. Lower grades have not advanced. Market not strong.

**Produce Exchange wholesale quotations are as follows with actual selling price to the trade 2½c advance on Extras.**

| | |
|---|---|
| Creamery per roll | 67½@70 |
| Dairy per roll | 30 |
| Eastern creamery per roll | 67½ |
| Cooking | 27 |
| Ladles | 25@26 |

### Cheese.

| | |
|---|---|
| Anchor large | 20 |
| Northern fresh | 18 |
| Anchor Young America | 21 |
| Domestic Swiss | 23 |
| Imported Swiss | 31@32 |

### Eggs and Poultry.

No fluctuation in eggs in the past seven days. Market firm with case counts held two cents in advance of following quotations:

Paying price f. o. b. L. A. is:

| | |
|---|---|
| Eggs | 41@43 |
| Case count buying price | 38 |
| Eastern | 34 |
| Storage | 32 |

Dealers pay for live poultry f. o. b. L. A.:

| | |
|---|---|
| Hens per pound 3½ up | 17 |
| Stags and old roosters | 8 |
| Fryers 2 to 2¾ lbs. | 16 |
| Broilers 1¼ to 2 lbs. | 19½ |
| Roasters 3 lbs and up | 16 |
| Turkeys | 19@22 |
| Geese | 12 |
| Ducks | 12@13 |
| Squabs | 1.25@1.75 |

### Live Stock.

**The following quotations are f. o. b., Los Angeles, on all stock.**

| | |
|---|---|
| Hogs from 175 to 200 pounds | 7½ |
| Prime steers | 4@4¼ |
| Heifers | 3½@3¾ |
| Calves per pound | 5 |
| Sheep ewes per head | 3.75@4.00 |
| Lambs per head | 3.25@3.50 |
| Wethers | 4.50@5.00 |

### Potatoes.

Wholesale prices are:

| | |
|---|---|
| Yellow sweets per ctl | 1.50@1.75 |
| Burbank local | 1.25 |
| Highlands | 1.10@1.25 |

## San Francisco Markets

SAN FRANCISCO, Sept. 28, 1909.

### Butter.

Butter is firm, though there is no large movement. In fact a half cent decline is noted during the week.

The official quotations of the San Francisco Wholesale Dairy Produce Exchange for today are as follows:

| | |
|---|---|
| California extras per lb. | 32 |
| Cal. firsts | 30 |
| Californa seconds | 28½ |
| Packing | 25 |

### Cheese.

| | |
|---|---|
| California flats | 14½@15½ |
| Cal. Young America fy | 15@16 |
| Young American Oregon fy | 17 |

### Eggs and Poultry.

An advance of 3 cents is to be noted this week with a firm condition.

Official quotations of the S. F. Wholesale Dairy & Produce Ex. are:

| | |
|---|---|
| Fresh ranch extras | 43½ |
| Firsts | 34 |
| Seconds and thirds | 24@30 |
| Hens per doz | 5.00@12.00 |
| Roosters per doz | 4.00@10.00 |
| Fryers per doz | 5.50@6.50 |
| Broilers | 3.00@5.00 |
| Geese per pair | 2.00@2.25 |
| Ducks | 4.00@8.00 |
| Turkeys | 19@25 |
| Pigeons young | 1.00@2.25 |

### Live Stock.

San Francisco prices gross weight:

| | |
|---|---|
| Steers | 2¾@4⅜ |
| Cows and heifers | 2@3⅜ |
| Hogs | 4½@7¼ |
| Calves per lb | 4@5¼ |
| Milk lambs | 5¼@5½ |
| Wethers No. 1 | 4¼ |
| Ewes No. 1 | 3¾ |

### Potatoes.

Wholesale market quotations:

| | |
|---|---|
| River Whites | 60@75 |
| Salinas | 1.25@1.50 |
| Sweets crates | 1.60@1.75 |
| Oregons | 1.15@1.25 |

### Vegetables.

Wholesale quotations:

| | |
|---|---|
| Asparagus per box | 50@1.00 |
| Bell peppers per box | 50@60 |
| Cabbage per box | 2.00@2.25 |
| Cauliflower doz. | 75@1.00 |
| Carrots per sk | 65@75 |
| Cucumbers per box | 50@65 |
| Celery, doz | 25@30 |
| Chili peppers per box | 40@75 |
| Corn per sk | 75@1.25 |
| Egg plant per box | 50@75 |
| Green peas per lb. | 4@5 |
| Okra | 25@40 |
| Onions green per box | 50@60 |
| Rhubarb per box for bay | 1.25@1.50 |
| Squash per box | 40@65 |
| String beans | 2@5 |
| Tomatoes | 25@60 |
| Wax beans | 3@4 |
| Lima beans | 5@6 |
| Garlic | 4½@5 |

### Onions.

| | |
|---|---|
| Yellow onions | 60@70 |

### Citrus Fruits.

| | |
|---|---|
| Valencias | 1.50@3.00 |
| Grapefruit | 1.00@3.25 |

| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

Scott, Magner & Miller Say:

There has been received on the San Francisco market for the week just ended 5000 tons of hay. This is 1000 tons in excess of what we received during the preceding week. A large part of this amount consisted of alfalfa hay and of the poorer varieties of horse hay.

The market has remained about as reported a week ago. The medium and poorer varieties of hay being dull and neglected, and difficult to dispose of satisfactorily, while the higher types of hay have been in better favor, and in some instances sales at above our quoations have been made.

It is usually the case that when hay first begins to move from the storage warehouses in the country at this period of the season, the market advances sufficiently to cover the additional costs of storage, insurance, etc., but it is a question this year whether this natural advance may be looked for under the prevailing conditions.

Alfalfa hay is being rushed in from every section, and the market on this article is decidedly weak and no tendency on the part of buyers in the country to take in any round lots.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 18.50@19.50 |
| No. 1 wheat or wheat & oat | 17.00@18.00 |
| No. 2 wheat or wheat & oat | 14.00@15.00 |
| Choice tame oat | 16.00@17.00 |
| Other tame oats | 14.00@15.00 |
| New crop wild | 11.00@15.00 |
| Stock hay | 8.00@9.00 |
| Alfalfa | 10.00@13.50 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.70@1.75 |

## Citrus Market

LOS ANGELES, Sept. 29, 1909.

The Valencia market seems to be dragging the past few days, owing principally to the large number of small sizes and also to poor quality of some of the shipments. There are perhaps 300 cars yet in California to be cleaned up in the next four weeks. If the present rate of shipment is continued they will be cleaned up even before the first of November.

Lemons are higher and the market is very good. All stock going forward now is new and of exceptionally good quality. Shipments are very light, not exceeding eight to a dozen cars a day. Every promise is for good returns for some weeks.

### Shipments.

Total shipments of citrus fruit since November 1st, 1908; 37,123 cars, of which 31,109 were oranges and 6,014 lemons. To same date last season there was a total of 28,886 cars, of which 24,300 were oranges and 4,586 lemons.

## RULES FOR DEALING WITH THE FLY NUISANCE.

Keep the flies away from the sick, especially those ill with contagious diseases. Kill every fly that strays into the sick room. His body is covered with disease germs.

Do not allow decaying material of any sort to accumulate on or near your premises.

All refuse which tends in any way to fermentation, such as bedding straw, paper waste, and vegetable matter, should be disposed of or covered with lime or kerosene oil.

Screen all food, whether in the house or exposed for sale.

Keep all receptacles for garbage carefully covered and the cans cleaned or sprinkled with oil or lime.

Keep all stable manure in vault or pit, screened or sprinkled with lime, oil or other cheap preparations, such as are sold by a number of reliable manufacturers.

See that your sewage system is in good order; that it does not leak, is up to date and not exposed to flies.

Pour kerosene into the drains.

Burn or bury all table refuse.

Screen all windows and doors, especially in the kitchen and dining room.

If you see flies, you may be sure that their breeding place is in nearby filth. It may be behind the door, under the table or in the cuspidor.

If there is no dirt and filth there will be no flies.

If there is a nuisance in the neighborhood write at once to the health department.

## THE GREATEST MAN THAT EVER LIVED.

Teacher—Johnny, who was the greatest man that ever lived?

Johnny—I don't know for sure, but I think it was ma's first husband.—Exchange.

Slamming the door of the oven makes the cake fall.

All canned fruit should be kept in a cool dark place.

Drop a little lump of sugar among the turnips while cooking; it improves them wonderfully.

Curate—And so, Mrs. Howard, you come to church every Sunday?

Mrs. Howard—Yes, Mr. Priestly, we're such strangers in town yet that we have no other engagements.—Brooklyn Life.

Steadily the rain is falling,
In the sky no blue appears;
But the sun is just behind the
Prism of those crystal tears.
—Margaret Sangster.

## USING THE SIMPLES.

(Continued from Page 316.)

also needed by the fruit, therefore it is well to mix the three ingredients together and work well into the soil, either late in the fall or early in the spring.

There are few crops that respond more readily and profitably to an application of nitrate of soda than citrus fruits. It may be used liberally when there is a lack of new wood growth, where the foliage is small and pale and where the fruit is undersized. Good results will follow two or more applications but one of them should be made early in the spring before blossoming time. If the rains will allow, a couple of pounds per tree should be applied to the soil, even if there is a cover crop, directly under the branches, and within a radius of one foot of the body of the tree. This should be spaded under. This application should be made in February. Just before the blossoms are fully developed, two or three more pounds may be distributed between the rows and cultivated in. Some find an advantage in using a couple more pounds about the time the young fruit is the size of a pea. The latter application may be made no nearer than four feet to the body of the tree, and worked in the soil by means of a harrow or cultivator.

### Not Easily Lost.

Recent experiments have proven conclusively that, notwithstanding its solubility, nitrate of soda does not leach out of the soil readily. The capillary attraction of the soil, when in good tilth, will retain it until the plants uses it. Therefore, if more convenient, a heavy application just before blossoming time, may suffice.

### Immediate Action.

Nitrate is of special value in forcing rapid development and early maturity of garden crops. A hundred pounds per acre should be worked into the soil just before the seed is planted, and other applications of from fifty to seventy-five pounds per acre may be applied between the rows and cultivated in between three and six weeks later. When the farmer has a barrel or tank spraying outfit, a solution can be made of nitrate and applied between the rows.

Recent experiments made in the asparagus fields of California have demonstrated the value of nitrate for that crop, even when it is grown on reclaimed marsh lands. An application should be made late in the winter before the new shoots start to grow; also after the cutting 100 pounds per acre can be advantageously used to promote a new top growth. The success of the next year's crop depends on having a good top growth during the late summer. As stated in the beginning of this article, the three elements, nitrate of soda, phosphoric acid and potash, are necessary to produce the maximum crop. One cannot take the place of another and all three must be present, either naturally or applied, if the high-producing qualities of the soil are maintained.—C. L. Watson.

## DETERMINATION.

"Why don't you get rid of that mule?"

"Well, suh," answered Mr. Erastus Pinkley, "I hates to give in. If I was to trade dat mule off he'd regard it as a personal victory. He's been trying foh de las' six weeks to get rid o' me."—San Francisco Star.

# Business Notes

The most timely feature of the October Century is the Clermont chapter of "Fulton's Invention of the Steamboat," written by the inventor's great-grandmother, Mrs. Alice Crary Sutcliffe. This second of two valuable historical articles is devoted to the Clermont's making, launching and history; and the narrative includes many of Fulton's own letters and manuscripts now published for the first time, in addition to autographic plans for the Clermont, recently discovered. Other timely articles of the number include Mr. A. Barton Hepburn's discussion of the question, "Is a Central Bank Desirable?" contrasting the rigidity of the United States currency with the flexibility of the currency of other nations; also two articles on the growing use of the "finger print" system of identification in governmental and business circles. Charles B. Brewer tells of their use in the United States navy and elsewhere; and Jay Hambidge has much of interest to say on the remarkably successful use by the New York police of this new method of identifying criminals.

### A VALUABLE POULTRY BOOK FREE

A book which no owner of fowls can afford to be without, is the brand new, 1910, enlarged edition of Conkey's Poultry Book, for it is full of practical directions boiled down to ordinary common sense by men who know the poultry-raising business from A to Z. It goes at the subject without gloves and rips the false, the frivolous, and the non sensical, from the solid facts and gives you good, practical money-making suggestions for all that the poultry raiser needs to know.

This valuable work is sent absolutely free if you will pay the postage and name the party from whom you purchase your poultry supplies. Send four cents in stamps for postage. The edition is limited and they are going like hot cakes. The name and address of the firm issuing them is The G. E. Conkey Company, Dept. F. 3, Cleveland, Ohio.

## SMALL CUCUMBER PICKLES.

For this none of the gherkins should be more than three inches in length. Lay them in alternate layers with salt in a large crock and pour in enough cold water to cover all, weighting the gherkins down with a large plate, on which is laid a stone. The pickles should be kept in the brine for ten days and stirred from the bottom every other day. At the end of the appointed time pour off the brine and pick over the gherkins. Throw away those that are decayed and soak the others in fresh water for two days. Your next step is to green the pickles by lining your kettle with grape leaves, arranging on this the cucumbers in layers, sprinkling a pinch of powdered alum over each layer. One teaspoonful is enough for a large kettle. Cover the pickles with cold water. Lay three thicknesses of grape leaves over them, cover closely and cook slowly for six hours. Take out the pickles and throw into very cold water. Make a pickle vinegar of four quarts of vinegar a cupful of sugar, three dozen each of whole black peppers and whole cloves, 12 blades of mace, 18 whole allspice and boil together for five minutes. Drain the gherkins from the water, pack them into jars and pour the scalding vinegar upon them. Keep in a dark closet and do not use for at least two months.—Portland Oregonian.

Freshman—Who is the smallest man mentioned in history?

Sophomore—I give up.

Freshman—Why, the Roman soldier who slept on his watch.—University of Pennsylvania Punch Bowl.

90 H. P. "Western" Pumping Water for Western Water & Power Co., Glendora, Cal.

# A Vast Difference

exists between "good enough" and "the best." There are any number of gas engines which are "good enough" for many purposes and people, but only "the best" should be considered for any high class proposition.

The **WESTERN** is the best gas engine built on the Pacific Coast, and while the first cost is of course more than that of the very cheap engines, yet it is no more than that of any standard engine, and this necessary difference in price is soon liquidated by the greatly lessened cost of fuel and repairs, after which your engine is a paying investment and a constant source of satisfaction to you.

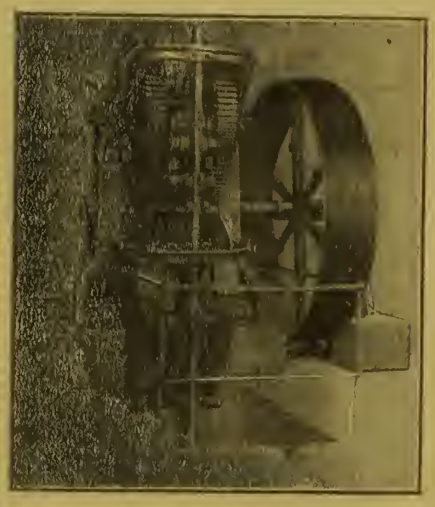
The **WESTERN** saves 25% in fuel cost over other makes, being able—by reason of its special patented features—to develop a horse power hour with the least amount of the cheapest fuel.

With the Nix-Frost Crude Oil Gas Producer (Patented) a gallon of **Crude Oil** has the same power value as a gallon of Distillate. Ask us about it.

## Western Gas Engine Company

**Northern Branch: 461 Market St., San Francisco, Cal.** **Los Angeles, Cal.**

# The Smooth Running, Noiseless Pomona Deep Well Pump



It is thirty to fifty per cent more efficient than any centrifugal pump ever made. No high speed bearings to cut out. All breakages and rod troubles eliminated.

This is the only pump you can afford to buy if you consider your own interests. Hundreds of satisfied users testify to this.

Used by the best water companies who know what a good pump is.

Send for a catalog or what is better come to POMONA and let us show you some of these plants in operation.

# Promising Strains of Mayettes and Franquettes

Observations on Blight Resistant Varieties. Written for the California Cultivator

By LEONARD COATES, of Morganhill.

THERE are in California two great and distinct regions for the growing of the walnut:—the Sacramento Valley and the smaller valleys all along the coast line, and more or less influenced by the moisture-laden breezes and summer fogs from the ocean. Of course no arbitrary or exact line can be drawn as separating these two districts, some of the smaller valleys debouching from the Coast Range having as warm a summer climate as the Sacramento Valley.

As to the adaptability of the coast region for successful walnut culture, it is unnecessary to enlarge thereon, because of the great proportions which the industry has assumed in Southern California, especially in Santa Barbara, Los Angeles and Ventura counties, but also up north all the way to Sonoma, in which county, and in Napa, are some of the oldest walnut trees in the state.

**In the Interior.**

The cultivation of the walnut in the interior has not been extended at present into anything approaching an industry of commercial importance, and for two reasons, first, because the farmers have not had their attention called to the walnut as a profitable crop, with facts presented to back up the statements, and, second, because of the lack of knowledge existing as to the varieties to plant.

The adaptability of the Sacramento Valley for walnut culture is unquestioned, as is substantiated at the outset by the well-known fact of the prolific growth everywhere of the species indigenous to this state, and commonly known as California black walnut. I mention this particularly because it is assumed here that all walnuts should be grafted on this native root.

**Bacteriosis**

The great bugbear which walnut growers have had before them for many years has been Bacteriosis or walnut blight, and after a long period of investigations carried on by both Government and experiment station experts, the conclusion arrived at, and so announced emphatically and publicly, is that dependence must be placed upon the discovery and propagation of varieties which are apparently immune from this disease, and which yield nuts meeting the requirements of the market.

**Immunes.**

I believe these varieties have been found, and will attempt to describe them fairly. Those who wish to investigate the matter still further are invited to visit the large bearing orchard of Mr. Ely I. Hutchinson at Concord, who grows the nut bearing that name, or the orchard of Mr. Rudolph Wiltz, 16 Lucretia Avenue, San Jose, where the "San Jose" or Improved Mayette may be seen in all its glory. Many prominent growers who have visited these orchards can vouch for the accuracy of the descriptions given.

The original tree of the Concord walnut is growing on the property of Mr. Geo. M. Westcott of Concord, and Mr. Hutchinson has grafted extensively from that tree, which originated with the late Felix Gillet. The tree is extremely vigorous, with very large foliage, and forms a rather compact well-rounded head. It is an enormous bearer, the nuts being of good size, round, smooth, and of fine quality, with light-colored pellicle, or skin. The nuts hull early and naturally, falling to the ground quite clean, and requiring no bleaching. No disease has attacked this walnut, and the original tree is 16 years old. The orchard is situated at the foot of Mt. Diablo, the summer heat often being intense, so that it would be taking no risk on account of sunburn to plant Concord in the interior. It blooms later than the Santa Barbara Soft-Shell, and varieties of that type, but not so late as Franquette or Mayette.

This is the immune variety recommended for planting in the Sacramento Valley.

**Another Improved.**

The Mayette, called by Mr. Wiltz "San Jose," to distinguish it from the ordinary variety of that name, is distinctly an 'improved" Mayette, the nut being much larger, and the tree being a better bearer. This also originated with Mr. Felix Gillet, but Mr. Wiltz named it, and has the only bearing orchard.

The tree is vigorous, open and spreading, with light foliage as compared with Concord. This is the main point constituting its great value for the Coast Region, when all its other good points are taken into consideration, as, where summer fogs occur free circulation of air and sunlight is desired to render a variety less liable to bacterial or fungous diseases. Compared with the Concord, the nut, while of the same type, is larger, although the Concord is apparently rather the heavier bearer. The "San Jose" Mayette blooms late, but it also matures its fruit early, the nuts falling to the ground smooth and clean, and not requiring to be bleached.

Both of these varieties are of the Grenoble type which is, as anyone may see by referring to market reports from France, the nut of commerce. The best market insists on a smooth, round nut, well closed at the apex, white pellicle, and good quality: both of these will answer to these requirements.

**Seedlings Unreliable.**

The Franquette, which produces rather a long, pointed nut, has been planted largely, both seedlings and grafted trees, and also trees grafted from seedlings. All seedlings are absolutely unreliable, and to graft from miscellaneous seedlings most reprehensible.

## HORTICULTURAL CLUB MEETING.

PROBABLY five hundred people gathered at Ganesha Park, Pomona, last week, in response to the invitation of the Claremont Horticultural Club to listen to an address by Senator Frank P. Flint. The occasion was the first meeting of the year after the usual summer vacation.

Prior to the luncheon there was a discussion by Mr. S. A. Pease of San Bernardino, Mr. Beemis of Covina, Prof. Summer of Claremont, and others, as to the necessity for better work in fumigation and more intelligent inspection of orchards to keep them free of the pests which take so much from the pockets of the growers. Claremont growers have been especially insistent on what they call the block system, that is, taking a certain section, thoroughly fumigating and ridding it of insect enemies, then cleaning up the adjoining blocks, etc. Referring to this, Mr. Beemis said that in theory it was perfect, but its practical working out in a large county almost impossible. In a small community it might succeed, but the weak points in the horticultural laws so embarassed the inspectors that they could not secure uniformly careful work in a large way. The opponents of this idea advanced by Mr. Beemis insisted that the plan was worthy of a fair trial and that all pressure possible should be brought to bear on those who were backward about having careful work done. There was some diversity of opinion as to the value of the Woglum system of marking tents and fumigation, but a vote on the question called forth a unanimous endorsement. The only adverse criticism was that the cost was slightly increased, but it was the general sentiment that the greater efficiency more than offset this.

Senator Flint declared that the recently enacted tariff bill was the most effective measure ever enacted in this country. He deprecated the endeavor to discredit the framers of the bill, and reminded his hearers that it is impossible to frame any bill which will be universally acceptable; that what the Pacific Coast wants is in no wise agreeable to the New England States or the Middle West; that the ultimate bill must be the result of a policy of give and take. California would have liked a lower rate on manufactured articles, especially shoes and wollens, and other goods which she does not produce; New England would have appreciated free citrus fruits, raisins, nuts, and other California products. The Senator declared that this Coast has received more advantages from the tariff in proportion to her productions than any other section of the United States, and should be entirely satisfied with the completed bill. Wipe out this act and the protection it affords, and the citrus groves of California would be uprooted and the factories in other sections of the country would be closed. Over fifty articles named in the bill are produced in California. The Middle West really had more ground for objecting to the bill than any other part of the Union.

Senator Flint gave especial credit to the California Fruit Growers Exchange for aiding to secure protection for citrus fruits. He said that such a co-operative organization was an indication of great intelligence and that it took intelligent co-operation to direct it as a working force. It gathered together and presented to him facts and statistics which made possible the holding of the orange and the increase of the lemon tariff. He said that orange and lemon raising could no longer be classed as infant industries, and for that reason opponents of the bill insisted that they should not be protected, but Judge Call insisted that so long as American workers in other sections received protective wages, so long should the lemon and orange growers demand that their workers get a living wage.

He referred to the great difference in prices to producer and consumer, raisins for instance bringing two or three cents to the producer and selling in the retail market for fifteen. He enumerated a number of other articles to illustrate this diversity and showed that the ultimate high price paid by the consumer was caused by the great profits of wholesaler and retailer more than by any protection afforded by tariff measures.

The strongest point made by the senator was in condemning the action of the railroads in raising the freight tariff. He said that these people seemed to be drunk with their own power and intimated that their latest action would lead to the granting of greater power to the Interstate Commerce Commission by the next Congress. He declared that the example of Theodore Roosevelt had aroused the American people and instilled into them sufficient ginger to demand, and he believed to receive, from Congress protection against trusts and aggregations of large capital. In illustrating the situation brought about by this action of the railroads Senator Flint told the story of the bully who entered a bar-room and announced with a flourish that he could whip the best man in the town. Those sitting about the room paid no attention to him, and with another swagger he offered to whip the best man in the country. Still getting no answer, his bravery increased so much that he announced he could whip the whole bunch and the best man in the state. At this a big ungainly fellow slowly straightened up and in the next few minutes so thoroughly whipped the fellow that as he picked himself up from the floor he remarked that he had "kivered a leetle too much territory that last time." This the speaker said was the case with the railroad people. In raising the lemon freight tariff, they had "kivered a leetle too much territory."

The American people are very sensitive to the fact that the large aggregations of capital have appropriated to themselves the benefits of the protective tariff. This has been so openly and brazenly announced by the railroads by raising the lemon freight rate that the senator said he would have a hard time explaining to members of congress whom he had asked to support the raise in lemon tariff, why it was that the railroads had so promptly presumed to take this as for their own advantage.

In conclusion Senator Flint pledged himself to do his utmost to wipe out the effects of this injustice attempted by the railroads.

## SOIL EXPERT.

At the meeting of the Lemon Men's Club at San Fernando and at the more recent meeting of the orange growers at Pomona, resolutions were passed endorsing the work of Messrs. Powell and Woglum and others of the Department of Agriculture in advancing the fruit interests of California. Resolutions were also passed urging upon Secretary Wilson of the Department of Agriculture, the sending of a man to California who shall be qualified to investigate as to methods of fertilizing. This action was taken at the suggestion of Prof. Cook. The committee appointed at San Fernando, consisting of A. F. Call, R. C. Allen, and A. J. Cook, drafted the resolutions, and another committee was appointed by Pres. Cook of the Claremont Club last Monday, which will doubtless draft similar ones. The San Fernando resolutions were as follows:

Resolved; that we recognize with exceeding gratitude the splendid work of Professor Powell and Mr. Woglum of the Department of Agriculture, which has saved hundreds of thousands of dollars to our citrus growers.

Resolved Further; that we recognize the great importance of thorough investigation by an expert, of our soils with reference to the use of fertilizers. We are all in the dark, and yet are spending hundreds of thousands of dollars annually. We recognize that this work must not only be conducted by one very able and learned, but will of necessity take many years before its completion.

Therefore Be It Resolved, that we petition Secretary Wilson that he send us through Dr. B. T. Galloway, the chief of the Bureau of Plant Industry, a competent person to perform this work.

---

It beats all how many things we can find to be improved if we look for them. Such a searching is less helpful than enumerating the joys of our lot.

---

With a good windmill and pressure tank, it is possible to have a water system on the farm without severe expense.

---

Some farmers are always driven with their work while others keep it in hand from the very start.

---

The farmer's desk is no longer a thing to be made fun of. It should be and is much used.

---

Farm bookeeping is necessary if you would be thoroughly posted and successful.

# A Great Aid in the Control of Red Spider

## Hydrated Lime Has Added to the Efficiency of the Sulphur Spray and Also Removed the Danger of Injury to Leaf and Fruit

THIS is one of the worst pests of the orange orchard and has caused much annoyance and great loss to growers. The problem of its control has been found difficult to solve. The worst feature of the pest is that when the effects of its work become observable, its activity is largely ended, its life is finished, and there is no possibility of reaching it until the next brood appears. The close observer soon learned to note the first indications of its work and used the best methods at hand to control it. For years the distillate spray or emulsion was used, but the necessity of repeating frequently made this not only expensive but ultimately proved injurious to the trees and fruit. Dry sulphur thrown into the tree by hand was tried and found more effective, but expensive in both material and labor. Another remedy which has been in use for several years is the sulphide of potash spray mixture. This was composed of potash, sulphur, salt and water. It was not very expensive and was reasonably sure death to the mites infesting the tree and remained effective for some time after spraying.

A Cloud of the Sulphur and Lime Envelops the Tree.

The introduction of the dry spray process originally was taken to kindly in but few instances, but the results of the dry spraying of powdered sulphur in destroying the red spider have been such that the wide-awake orchardist must take notice.

Flowers of sulphur alone is effective in killing the mite, but it was soon observed that its use was injurious to both leaf and fruit. This was caused by the chemical action in the release of sulphurous acid. While death to the mites, it destroyed the tissue of leaf and rind of fruit. If something could be secured to neutralize this acid and at the same time dilute the sulphur to a certain extent, it was plain that it would prove a most satisfactory insecticide. Air slacked lime was tried but not found satisfactory, but the use of hydrated lime has proven to quite successful. Here the sulphurous acid liberated by the sunlight from the flowers of sulphur unites with the lime and forms a sulphate of calcium which is, in homely terms, gypsum, or land plaster. Therefore, instead of proving injurious, the dust spray becomes beneficial as an insecticide, is harmless to the tree, and the residue improves the soil.

Learning of the use of this dust spray on the orchards of Covina and San Dimas by Mr. D. S. Stowell, one of the veteran fumigators and sprayers of the state, the writer visited that section recently and was shown some of the finest orange groves in the world, promising for the coming year fully ninety per cent of last year's crop. This is far in excess of the average for the state.

Passing from Tree to Tree.

The work of the red spider has been so destructive that Mr. Stowell has given especial attention to finding a means of controlling it. He has discovered that the use of the sulphur-hydrated lime mixture is most effective, not only at the time of application, but for weeks and even months afterward. Before visiting the machine which was at work, we drove through an orchard which had been sprayed or dusted two weeks before. The odor of the sulphur was still perceptible and it could be seen on every leaf and fruit on the tree. Mr. Stowell says that he has found the most satisfactory proportion of the two chemicals to be 75 parts sulphur to 25 parts hydrated lime.

We observed the spraying machine at work on the ranch of Mr. E. Teague on old trees from fifteen to twenty feet high. These trees were taking from one to one and one-fourth pounds of the material, the cost being only about seven cents per tree. The illustrations shown on this page give something of an idea of the method of the work.

There is only one outlet for the power blower which is handled by the attendant so as to direct the dust to all parts of the tree. The spray wagon drives through the orchard without stopping, but the dust is thrown out in such quantity that the tree is almost completely enveloped with a great cloud of dust. The effect is such that if spraying is done on an exceptionally hot day, one can scarcely walk through the orchard because of the strength of the fumes. Immediately after the spray wagon has passed the trees, one may go to them and find that the dust is readily shaken off, but if undisturbed for a night or two it becomes fixed by the moisture in the air and remains on leaves and fruit until vaporized.

One of the most interesting sights we have seen is the manufacture of this hydrated lime. It is not a secret process, but is yet far more than a simple addition of water to lime—as its name would imply. The lime is run through a crusher and reduced to a fine powder, then carried by a conveyor to a large drum or mixer. In this mixer the water is placed in sufficient proportion to reduce the lime to an impalpable powder. It is then carried by another conveyor to the sacks. The factory of which we speak is that of W. H. Taylor, 846 Commercial St., Los Angeles, and the lime produced there is used by Mr. Stowell in his successful work in the Covina and San Dimas section. Mr. Stowell states that he has found Mr. Taylor's product uniformly dependable.

The machinery for applying the dust spray is shown in the engravings, and is merely a small gas engine which manipulates a mixer in the drum containing the spray material, together with a blower which causes the dust effect noted in the engravings.

The Machine.

### BACTERIA THAT DESTROY MANURE.

It is an error to regard barnyard manure as material that if properly protected will retain indefinitely its manurial value. At the best the operations of the bacteria that destroy it can only be checked, they cannot be hindered entirely. Two very different classes of bacteria work on manure. One class is the group that live in the open air and thrive only when air is supplied to them in abundance. These work on manure when it is exposed to the air. The other class consists of the group that live without air. They work best when they are in liquid. So, even the man that provides a great tank for holding liquid manure only delays the time at which its fertility will disappear. These latter bacteria are called anaerobic bacteria. They begin to work on the organic matter of the liquid manure as soon as it is accumulated sufficiently so as not to be exposed to the air. They go on destroying the organic matter just as the ferments in sweet cider destroy certain things in it and create acids. In the course of a comparatively short time the manurial value of liquid manure is destroyed by them. The only way to prevent them acting to the detriment of the fertilizer is to get it into the land.

# Deciduous Fruit Culture

### PLACER COUNTY GROWERS.

FRUIT growers of Placer county and many other sections of the Sacramento Valley met in Newcastle last week and gave the day up to discussions of methods of fruit marketing. Incidentally, fruit culture was touched upon, but the one point receiving greatest attention was that of a good honest pack of clean fruit.

The meeting was presided over by J. W. Jeffrey, State Horticultural Commissioner, and several speeches were made urging that greater attention be given to packing and to the eradication of fruit pests.

Frank McKevitt contended that California has more rivals among other states right now than ever before in its history, and that it was vital that all fruit shipped from here should be sound and of the best quality; that while we are handicapped by distance from the Eastern markets, still, we grow the best fruits in the world, but that we are fast losing our reputation on account of sending on green and wormy fruit. If one-fourth of a shipment is bad, said the speaker, that condemns the whole three-fourths. The speaker believed that an inspector ought to be appointed and paid by the fruit men to inspect all packs, and turn down all wormy or undersized fruit.

Supervisor Brennan of Loomis was present, and after a talk regarding the needs of the fruit interests for better inspection, stated that he would lend his support to all measures that were for the horticultural interests of the country. This pledge was received with satisfaction and general applause by all present. A commissioner will probably be appointed in due time as soon as one is found who will qualify under the new law which provides that he must be a capable man and able to stand the examination prescribed by the state examining board.

Chairman Jeffrey referred to the successful work accomplished by the orange shippers and county inspectors of the south, mentioning the fact that the county horticultural commission of Los Angeles spends nearly $12,000 a year for aiding in keeping its orchards free of pests, and Riverside and San Bernardino counties spend each about $10,000 a year.

J. M. Francis of Auburn declared that the prices of fruit were fixed by the shippers. He said that Placer county was now furnishing 80 to 85 per cent of the f.o.b. shipments, and that it was in the hands of the shippers to demand better returns and that each should separate his more desirable fruit from the lower grades and get first-class prices for first class fruit.

J. P. Dargitz, of San Joaquin, said the habit of selling for cash to the grower put a big premium on trickery; that whenever the growers knew they were going to get cash for their fruit at the houses they cared little whether they shipped good or indifferent fruit.

The fruit grower, the speaker contended, must know that unless he puts up first-class fruit he will not get top prices.

H. M. Branstetter, of Loomis, strongly advocated a plan to have one central packing-house in each district, and pay men to pack the fruit at such packing-houses in each district, instead of having the fruit growers pack their own output on their own ranches. Branstetter thought this would be cheaper to each grower, and would cause a higher grade of fruit to be shipped, as each shipment would be publicly scrutinized.

A resolution was unanimously adopted calling upon fruit men to grow a higher grade of fruit and to insist upon a better pack and more attractive appearance. This for the good name of California as well as for the immediate financial benefit of Placer county growers.

### BURBANK AND PLANT BREEDERS.

The meeting of nurserymen and florists at Los Angeles last week to discuss questions brought up by the action of the Pasadena Gardener's Association criticising the methods of Luther Burbank, brought out a divided opinion. Los Angeles members were evenly divided while the Pasadena parties were unanimous in condemning the commercial methods used in disposing of the Burbank products.

The opening feature was the reading of a communication from Geo. C. Roeding of Fresno. Mr. Roeding took the position that Mr. Burbank's work was worthy of the highest praise and that the efforts to belittle his reputation emanated from a desire to share in the glory given him by the American people. He made mention of the Burbank potato propagated and introduced by him, also the crimson winter rhubarb, spineless cactus, plums, cherries, walnuts, gladioli, Shasta daisy, red flowering poppy, and many other plants.

P. D. Barnhart of Pasadena represented the other side. He maintained that he had no intention of plunging the horticultural world into "spasms" by the resolutions passed by the Pasadena Gardeners Association on August 6th. His principal argument was that Burbank was the biggest egotist he had ever met, and quoted largely from Mr Burbank's circulars in support of his contention, showing the encouragement given by the "wizard" to the fabulous stories of the yellow newspapers. He declared that Mr. Burbank had said to him, "I have the finest gladiolus in the world," and also quoted him as saying, "My work is of more value than that of all the state experiment stations, government experts, and all other experiment farms and gardens combined."

Theodore Payne of Los Angeles read a carefully prepared paper touching upon the fruits brought out by Mr. Burbank, especially maintaining that the wonderberry was his own production and that it had great merit. Dr. Houghton of Los Angeles most severely arraigned Mr. Burbank's methods. He was opposed by Mr. Wagner, also of Los Angeles.

The last talk of the evening was given by Herbert Goudge who gave a most admirable description of new varieties of plants produced. He denied that Mr. Burbank had ever made any claim to being a "creator" of plants, or worthy of more credit than any hard worker who assumes that he will have success and does have it. He has formulated no new laws; he is merely working in accordance with

those long known to the best scientists of the country. He has made many failures, but let him be judged rather by his successes. Next to his indefatigable labor, the best reason for his success may be ascribed to his powers of insight or intuition by which he is quickly able to determine whether or not a young plant will prove of value. In illustration of this point he referred to the same quality in young children in European countries who are employed by florists to sort out seedlings of a plant which grows both single and double flowering varieties. The single flowering specimens are of no value, and though the botanist De Vries stated that the differences between the single and double flowering plants were so slight that he could give no description of them, yet these children's perceptions are so keen that they pass over the flats of young plants and almost instantly pick out and throw away the undesirable ones. This the speaker said gave a faint illustration of Mr. Burbank's power, which enables him to quickly determine the value of young plants. Thousands upon thousands are thrown away by him, often to secure only one or a very few that are worthy of further trial.

No vote was take nor judgment passed as to the feeling of the audience. A beautiful display of roses and carnations was made by Mr. Turner of Dieterich & Turner.

Jacob Dieterich is president of the association and J. J. Reeves, secretary.

### FRUIT GROWERS' PICNIC.

Under the management of Messrs. R. H. Hille and C. D. Hubbard, the San Fernando fruit growers are planning to picnic next Saturday, October 9th. The forenoon will be spent in visiting the orchards of the valley. At noontime the ladies will serve a luncheon at the orange and lemon packing house, and in the afternoon addresses will be given upon matters of interest to orange and lemon growers. On the program we note: Our Orange Market by R. H. Wilkinson, Sales Manager of the Exchange; Our Quaker Neighbor, F. A. Fletcher, Whittier; Pathological Research, Prof. R. A. Smith, State Pathological Institute, Whittier; Orange and Lemon Planting in Early Days Around the Old Mission, J. T. Wilson, San Fernando; Our Lemon Market, T. H. Powell, Lemon Sales Manager of the Exchange; Insect Pests, Prof. Cook, Pomona College; Orange and Lemon Growing in Florida, Col. Reid; Orange and Lemon Market in Scotland, John Burr; The Youngest Man in the Exchange, R. B. Lyon, Hollywood; From the Orchard to the Car, O. B. Griffin, Manager Leffingwell Rancho; Our Association, R. H. Hille, Manager San Fernando Exchange.

When the farmer considers that a ton of well-cured alfalfa hay is worth about as much as a ton of wheat bran, he ought to see that it is profitable to protect it from the rain and dew. He would scarcely hesitate to provide suitable covering if he had several tons of bran in the field exposed to the elements. Hay-caps will soon pay for themselves by the finer quality of the hay they assure, aside from the larger quantity of the best grade that their protection guarantees.—From Coburn's "The Book of Alfalfa."

# The Shape of a Plow

from the share-point back a third of the way across the mould board determines whether it pulls heavy or light. Three-fourths of the friction comes on this part, and this part of a John Deere plow bottom is shaped to split the ground like a thin wedge splits a stick of wood—that's one reason why John Deere plows are easy on your horses and economical for you—why the John Deere is the lightest draft plow in the world—and why there are more of them in use than any other three makes combined. We sell the John Deere plows, and carry a large stock of farm machinery. We want your business.

# Live Stock and the Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

## INCREASING THE PROFITS.

By Mrs. M. E. Sherman.

FARMING is a two sided matter; the land must increase in richness and the crop in quantity each year to meet the increasing expenses of production. Taxes, food and clothes are growing more and more expensive. Wages are therefore higher, while this season the grapes and peaches bring the lowest prices in years. This is the time of profit for the wheat farmer, the dairyman and the beef breeder. It is wonderful how the prices balance up to the producer. He is never allowed long to have any one article a money maker, for the idle schemer of a commission man or packer comes in to eat the profits. Farmers organizations do not seem to be able to hold their own. The Grange, the Rochdale, and now the Farmers Union, all born of optimism, what have they done for us?

### Diversity.

The keynote of agricultural development in California today is the building up of the small farm. The small profits from a variety of products count up rapidly; if we have improved stock, improved vines, better farming, and above all better farmers, with constant employment for the hands. The argicultural laborer of today, is, like the school teacher, doing transitional work instead of making it a life study. The old Chinese we had ten years ago had made farming their life work, and we will never be likely to secure as competent help again. The idea of skimming over the land with eight and ten horse teams, putting in a crop lightly on the surface, is passing away and the grain drill is being used to put the wheat in more carefully. The old gang plows often skipped seeding for a round, but it did not matter as the work was cheaply done and land cheap. Now it all has come to count and less land is producing more grain than ever before.

### Dividing the Land.

One by one the great ranches are passing into the hands of the small farmer. The great Chowchilla ranch of 108,000 acres, that has stretched as a waste along the Southern Pacific track for miles, with only a few grain farmers, rickety old shacks in sight, will soon be sold in small tracts. This means much to every one, for it means homes and sweet children, women and civilizing influences to occupy the waste and dreary stretches. The Experiment work at Davis on cereals is bound to help the farmers increase the food supply. The knowledge to be gained from improved tools makes this State Farm well worth a visit I hope to see a large gathering there at the coming Farmers Week at Davis. The viticulturist and horticulturist are not far in advance of the dairyman today. Ten years ago the dairymen were very ignorant of the principles of their art. Now we have many Americans taking up dairying as a pursuit and the knowledge gained from the Government and Experiment Stations is bringing in results.

### Iowa Example.

Sometimes there are men born with public spirit enough to be a blessing to their community. Back in Iowa, Mr. W. W. March has started an idea that will bring great results to the dairymen. He has offered $1,000 to be divided into twelve prizes for dairy cows making the best tests. The only stipulation is that the cow must be an Iowa one. The American Jersey Cattle Club will double the money won by the Jersey cow. Some breeders have added pure bred bulls as additional prizes, while the separator people, as usual, are at the front with more prizes of separators for the winners. If all the men selling agricultural implements had the enterprise that the separator people show, the country would be full of disc plows, alfalfa spaders, grain drills, manure spreaders and a score more of tools that should be seen on every general farm. The tests of the cows in the March competition are interesting. During the first thirty days one-third of the cows, about 28 in number, have made over forty pounds of butter fat. When the sixteen per cent of over run is added to this it makes a creditable amount of butter for a month.

### Home Records.

I have been writing up cattle pedigrees lately of the home herd. The smallest amount of milk produced by any cow last year was 7054 pounds and 249 pounds of butter by a two year old heifer. The herd averaged 8052 pounds of milk and 314 pounds of butter per cow. This included everything in milking from the one teated cow to the two that were beefed. The cows had short feed last year, as the winter was a wet one and prevented the usual picking on the fields and part of the time it was impossible to haul hay from the stacks. Seventeen out of the thirty cows were heifers with their first calves. The best records will show up in the official testing of the herd. There are several five hundred pounds of butter cows now in the herd. The herd was fed last winter on alfalfa hay and corn silage. The rains, however, are very hard on the cows and this season I mean to try to keep them in the barn during heavy storms.

### Prices.

I have often wished I had kept a close record of the cost of grading up a herd. As I look at it now I would not try it over, but would buy the pure bred animals, keeping fewer from the start. It is as hard to condemn the grade cow to the butcher as it is to get rid of the trash that is bought at bargain sales. A stable full of poor cows represents as much waste on a man's part, as the house of a woman that hunts the bargain counter of the store. It is hard not to excuse the handsome grade cow that falls below the required standard, particularly hard if she has been raised from a little calf under the eye. I sometimes think I feel toward the calves as the typical old time spinster felt toward her cats.

Do you remember the old nursery rhyme?

Three old maids wearing the rue,
Dressed in yellow, pink and blue,
Nursing cats is all they do,
These poor old maids!

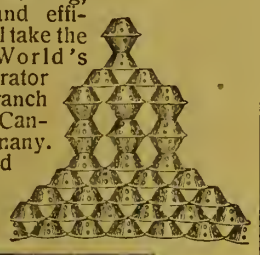
I heard a clever doctor make a variation of this:

Three old maids, dressed in pink,
Looking Oh so yellow! Feeling very blue.
Nursing cats is all they have to do!
These poor old malds.

# 1 Piece or 60?

You can get a modern cream separator—a Sharples Dairy Tubular—with nothing in the bowl except the piece shown here on the thumb.

Or you can get an out-of-date separator with 40 to 60 disks in the bowl, as shown below; or one filled with other contrivances—all needless in a modern machine.



For easy cleaning, durability and efficiency you'll take the Tubular. World's biggest separator factory. Branch factories in Canada and Germany. Sales exceed most, if not all, others combined.

# KOW KURE

Not a food, but a REMEDY. A specific remedy for specific troubles. Made for cows only. A most valuable aid to dairymen. KOW-KURE has a distinct medicinal value possessed by no other known compound, which makes it the greatest cow remedy on earth. It cures sick cows; it keeps healthy cows well and increases their productive power when fed regularly according to directions. KOW-KURE acts directly on the digestive and generative organs, tones up the entire system and is an unequalled disease preventive—a positive cure for BARRENNESS, ABORTION, SCOURS, RED WATER, BUNCHES, LOST APPETITE, MILK FEVER AND RETAINED AFTERBIRTH.

Mott, Illinois,

"I have used Kow-Kure for three or four years. With it alone I have cured all ailments that afflict cows. As a milk producer it has no equal." G. P. Lanterman.

We have thousands of similar indorsements. A trial will convince you. If your dealer cannot supply you write us direct. Send for free booklet, "The Cost of a Lost Cow." It contains money-making information for every cow owner. You can't afford to be ... it—remember it's free. ... today.

For Sale by All Dealers

I can understand anyone looking yellow and feeling blue when he turned off to the butcher a cow raised from a calf on the ranch.

**Calves.**

They are the sweetest creatures on the ranch, with their freakish little ways and the great big clear eyes that watch you unwinkingly, until you stand looking at them too hard and long. Then away they go down the yard, full of sudden self conscious shyness. They are babies in their ways, and respond to kindness with most inquisitive interest in all your clothes. They smell and then chew up the clothes of their friends, loving to lick the hands and face with their rough tongues.—M. E. Sherman.

## SHORT COURSE.

Last year many prosperous farmers were attracted to the Short Courses offered at the University Farm at Davis. A very instructive course was given along the line of animal industy and was largely attended. The course prepared for this year will be even more attractive. The work will be in charge of Professor Major and his two assistants, Mr. Howard Phillips and Mr. F. D. Hawk, graduates of the Iowa State Agricultural College, who have recently been added to the force of instructors. These young men were both members of winning teams in live stock judging and received individual honors in judging at the live stock shows held in Kansas City and Chicago, and come to the University highly recommended.

The Short Course in Animal Industry will begin November 1st, and continue until November 20th. The first week will be devoted to dairy stock and dairy interests. A course of lectures will be given on the various phases of dairying. The origin, history, importation and improvement of each breed will be studied, attention being paid to herd registry and to the register of merit. Selection, feeding, care and management from the standpoint of economical production of milk and butter fat will be discussed and practical work in judging dairy stock will be given each afternoon.

The second week will be devoted to cattle, sheep and swine. Lectures will be given on the origin, history and development of the different breeds; their place in our agriculture, a study of the different market classes, methods of feeding the breeding herd and methods used in feeding for the fat stock market. Two hours each afternoon will be given over to the judging of stock both from the breed and market standpoint.

The third week will be given to the subject of horses and mules and the lectures will include a discussion on the various breeds; their origin, history and adaptability to different soils and climates, the breeding, care and handling of the mare and the rearing of the colt, special attention being devoted to their feeding.

The last day of the course there will be a judging contest which will be open to all men under twenty-five years of age who have attended the course.

---

Prof. W. L. Carlyle is now at the head of the stock department of the A-Y-P Exposition, owing to the death of former Superintendent Wisdom.

# Small Fruits and Vegetables

### THIS MONTH.

PEAS for January table should be planted at once. Yorkshire hero is probably the best variety. Those who have locations well protected from frost may transplant tomatoes, and those who wish extra early spring fruit may plant seed in hot beds at this time. Of course, even in the most protected situations in California they will require special care if the seeds are planted now, but the pleasure of having winter fruit will well repay care given. Seeds of peppers may also be planted, and in addition spinach, radish onions, chard, turnips, lettuce, cabbage, and in fact all the hardier "early spring" vegetables.

Rake up dried vines, leaves and weeds. If any disease has prevailed in potatoes or other vines during the season, they should either be burned or composted and used on orchard or other than garden crop.

It goes without saying that the ground should be in the very best of condition and thoroughly moistened, not only on the surface but to considerable depth, if the seed are to be given a fair start in life.

### GROWING SPINACH.

Spinach is an annual plant used for "greens," and is in best demand in late fall and very early spring. It is very hardy. The seed stalks grow about two feet in height. Spinach leaves are rather large and succulent. It grows best in cool weather and is of very easy culture. In order to have the leaves and stalks tender there must be quick, rapid growth. which calls for a soil that is rich in humus and in fine tilth.

For a very early spring crop the seed should be sown in August or early September. One ounce of seed will sow 100 feet of drill, 12 pounds to the acre. The seed may be broadcasted or sown in drills one foot apart, but the drill system is best. Sow about 40 seeds to each foot of row and cover one inch deep. The seed is large in proportion to the sprout that has to push it up. If it is planted deep, and the ground crusts, it has trouble in getting through.

In market gardening it is best to apply nitrate of soda to the crop in spring, giving it as a top dressing, at the rate of 150 pounds to the acre. The nitrate of soda should be applied broadcast in two applications, about two feet apart, soon after the plants get nicely started. In about eight weeks the leaves will be large enough to gather. A dressing of hen manure is a good substitute for the nitrate of soda, in case the latter is not available.

When thus grown over winter the spinach field should be made into slightly raised beds six to nine feet wide, so that water will not stand on the plants. The rows should run lengthwise of the bed. It should be ready for use about April and May, and the crop off the ground in early June. F. W. Kilbourne, a New Jersey farmer, writes that by November 20 the plants on his place average about five inches across. With the beginning of winter he top-dresses the spinach with short horse manure at the rate of ten tons to the acre. He begins cutting early in the spring, cutting off the biggest and then cultivating. The cultivating and the nitrate of soda—of which he uses 400 pounds to the acre—forces it.—Globe-Democrat.

### ATTRACTIVE PACKAGES.

For the marketing of small fruits and vegetables to have them bring the greatest returns we must give some attention to the size and style of packages used. To attract the buyers in the large cities who have the money and are willing to pay for what they want, we must put stuff into those packages which are the most attractive, and still at the same time be handy to carry about. In shipping such produce as blackberries, cherries and plums, the package most generally used is the 24-quart berry case, while at the same time the same produce put up in neat shape in the 16-quart cases will sell for nearly as much as the larger size, with only two-thirds the fruit. Grapes often lie on the market and beg for buyers when put up in large cases, while a package of three or four pounds put up in neat, attractive manner, will sell beside the other at 25 cents and up per package. The eyes must be tempted. The one-third bushel basket is much handier for the shipment of beans than the bushel basket, and will often sell for about the same price. I have had green onions sell on the early spring market for 75 cents and $1 per one-third bushel peach case, while onions put up in the bushel apple box could hardly be sold at all, and even though they were sold they went at about $1.50 to $1.75.—Ex.

### TO TELL RIPE MELONS.

You might shut your eyes or be blind, and could easily tell by your nose. The ripe muskmelon has the peculiar strong melon aroma. But the changing color of the rind, from the deep green of fresh, active growth, to a dull yellowish shade, gives an unmistakable indication of approaching or attained maturity. The never-failing sign, however, is the ready parting of the melon from the stem. When you lift the melon and it comes or breaks off easily from the vine, the melon is right for marketing.

We often find our Emerald Gems and Gold Coins, etc., already loosened from the vine, so that we simply pick them up, and may eat them immediately, as they are then fully ripe. If they have to be lifted or in the slightest degree twisted in order to make them let go from the stem, the melon should be stored in a cool place, and will then, in a day or two, be found in prime condition for eating. Closer observation and better judgment are required to pick out the ripe watermelons in a patch. An expert, however, is seldom fooled. The inexperienced grower, however, is liable to make many and annoying mistakes.

As in the case of muskmelons, the changing color is about the best indication of ripening. The upper part of the melon loses its freshness of growth and becomes of a dull, I might say dead, green. Usually the tendril which grows on the vine directly opposite the stem of the melon dies and turns brown or black when the melon has reached its full maturity. The professional melon grower, however, tells more by the sound, when snapping the middle finger from the thumb against the melon, or by simply pressing it lightly with the hand, than by any other means. The ripe melon, when lightly pressed "cracks" or when snapped gives that dull sound which the fine and experienced ear of the old melon grower easily catches and knows. In short, it is easy enough to tell a ripe melon of any kind when you know how to use your eyes, nose or ears.—T. Greiner.

# The Ornamental Garden

### THIS MONTH.

THIS is bulb planting month. Nearly all bulbs may be put in at once. If Watsonias are still out of the ground they should be planted. These beautiful flowers are worthy of more general place than they have ever had. The writer has them already coming through the ground. Other bulbs which should be planted at once are; hyacinths, tulips, narcissi, Easter lilies, cyclamen, ranunculus, anemones, ixias, tritonias, sparaxis, freezias, and practically all Dutch bulbs.

Sweet peas should be planted and other annuals that were not planted earlier; pansies, mignonette, scarlet flax, stocks, scabiosa, phlox, and dianthus. Stocks and pansies that were sown early may be transplanted this month into their permanent beds.

If well rotted manure can be had which is not full of weed seeds, this is a good time to give a liberal application to the lawn, washing it through with the hose, and after a few days of thorough drenchings, rake off the surplus before it has time to kill the lawn in spots. This is also a good time to sow new lawns as they are less liable to be infested with bermuda than those planted in spring. Bermuda is essentially a warm weather grower and the blue grass planted now will have a chance to get a start of the pest.

If the lawn is thickly sprinkled with bermuda or completely taken by it, it will be benefited by an application of manure which will render it less liable to turn brown when the colder weather comes.

### METHOD OF ROSE GRAFTING.

By a new method of grafting Hugo H. Lillienthal, of Berkeley, Cal., has very recently discovered a new way of saving young roses from mildew and thus preserving from destruction from 50 to 75 per cent. of the roses of American gardens and hothouses.

Lillienthal's method is a grafting of tender slips upon the dog rose, the graft entering the dog rose bark obliquely, but not puncturing the core.

The dog rose, having hard, glossy leaves, able to resist the attack of the mildew, protects its little proteges and lends to them some of its own hardiness. The discovery is considered one of the most important of recent years to horticulturists.

Rosegrowers have found that the hardest problem they had to face was that of mildew. It is estimated that the mildew is responsible for the loss of from 50 to 75 per cent of the younger plants in commercial and private gardens. So destructive was the fungus, in fact, that horticultural journals, both in Europe and America, have been pleading for years with horticulturists to give their attention to this mildew problem.

Mr. Lillienthal's method is new in two particulars—both in the method of the graft and its application to the mildew problem. It will permit the production annually from each bush of not less than 3000 usable rose slips. The operation is a delicate one and requires the most care that is known to the horticulturist surgeons.—Portland Oregonian.

### FARM FENCE.

There are more farm fences in California than formerly. The settlement of unoccupied sections and the bringing in of more and more stock have caused the construction of division and field fences. In this state as a rule they have been fairly attractive in appearance, but it must be confessed that one often sees specimens which lend anything but attractiveness to the farm surroundings.

Fences have shown considerable evolution from the days of the stone wall or worm fence, and while the materials now cost far more than formerly, economical methods of construction, and construction which is more permanent make possible the building of an attractive fence at little more cost than the out-of-date ones of years ago. There are few features about the farm that add to or subtract from its appearance as much as the fence. The stock laws prevailing in this country allow yards and lawns to be left without enclosure, but a fence selected with discrimination and built with care is an attractive feature and a benefit.

Wire fencing today is constructed in so many styles that any taste may be satisfied. We may still find today in some places—possibly from poor work or slack wires—fences that are far from attractive and even ineffective in restraining stock. There is no excuse for this, for with care in setting posts and the use of proper appliances for stretching, a taut, true, effective fence is possible to every workman.

The cement post cannot yet be unqualifiedly endorsed, though it is a safe prediction that it will be the fence post of the future. Deeply and properly set, there is no reason why a fence should not now be constructed to last a lifetime.

We believe it would be most instructive for our subscribers to take a glance through some of the attractive wire fence catalogues and post themselves as to the different features of fences now in the market. A line dropped to either the California Anchor Fence Co., Stockton, the Pacific Fence Construction Co., 352 Market St., San Francisco, or the Standard Fencing Co., 151 12th St., Oakland, will meet with cheerful response and information on the fence question which will be educational.

It will add value to your farm to true up and fix up your fences.

### DURABLE WHITEWASH.

For every barrel of fresh lime add 16 pounds of tallow, 16 pounds of salt and 4 pounds of glue, dissolved. Mix all together and slack; keep covered and let stand a few days before using. Add water to bring to the right consistence to spread readily. For nice inside work strain it. When less than a half barrel of lime is used, the quality of the wash does not seem so good. It is better to apply hot, but it does well cold.

Teach the boys and girls small farming by allowing them to grow vegetables or flowers for market. The garden and truck patches are good places for this kind of educational work. Let them grow things and sell them and have the money for their own use. It is better than laying up money for them to use when you cannot direct its use.

MORSE'S TULIPS FOR CALIFORNIA

Morse's Tulips

Especially adapted to California.

Long Stemmed, Gorgeous Colors.

New stock of Holland, Japanese and other Bulbs just arriving.

Send your name and address for our 1909 Fall Catalogue.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 358, 359.

LEGAL QUERIES.—Ditch Right, 359.

## No Notice Filed

UP TO time of going to press it is impossible to learn whether the notice of advance in lemon freight rate has been filed with the Interstate Commerce Commission. Presumably it has not, and if such is the case, the rate cannot be advanced on November 1st as was earlier announced by the traffic association. The hope is freely expressed that the railroad people are being influenced by a sounder second judgment and have decided not to advance the rate at this time.

## Not Holding Organizations.

IN SPEAKING of efforts at co-operation which have at times promised so well in this state, but have not seemed to work out so successfully as in other countries, Mr. E. F. Adams in the agricultural department of the San Francisco Chronicle says:

"Our co-operative marketing societies are for the most part societies for "holding" crops rather than selling them, which is ruinous, and has done more than anything else to injure our raisin and prune trade. Nothing can change this except bitter experience continued long enough to convince even dreamers of their folly. We have produced a condition in which the trade of the country is handling as little as possible of some of our principal products, instead of as much as it can."

We surely have had some bitter experiences from attempts at co-operation in this state, so we should be ready to come together on a selling basis. The desire to corner a market and force people to come to our terms is very human and is not exclusively found on Wall Street. Our farmers are built on somewhat the same lines as Wall Street brokers but, unfortunately, do not possess their power over the market.

Mr. Adams does not refer in his article to the most successful co-operative marketing organization in the world, the California Fruit Growers Exchange, which handles for its members nearly twenty million dollars worth of citrus fruits annually. He does not need to go to Europe, as he does later in his article, to point out successfully operating organizations. Of course we cannot rival Europe in number of societies for we note in the article in question that according to statistics up to December 31st, 1907, there were as many as 1271 agricultural organizations for the benefit of the agricultural class in all lines, from agricultural insurance to marketing.

There is a great field here for efforts that will bring our producers together in a common sense co-operative organization.

## County Horticultural Commission

THE meeting of fruit growers at Newcastle last week was for the purpose of discussing methods of producing cleaner and better fruit, of securing more uniform and more attractive pack and touching to a certain extent upon the question of transportation. This is a step in the right direction. Newcastle and all that section of the Sacramento Valley is wonderfully favored by natural advantages and producers there have as a rule made the most of them, but some have failed to appreciate to the full the opportunities offered and have sent to market goods which were not a credit to their community. The growers assembled in this meeting discussed methods and took an advanced position on the question of producing the very best the section was capable of producing, and of packing in such an attractive way that their output would command the highest market prices.

Another matter taken up was the appointment of a horticultural commissioner for Placer County and without question sufficient sentiment was created to influence the supervisors to appoint a thoroughly competent man to look after the fruit interests. It is strange that the supervisors of many counties in the state refuse to recognize the importance of the fruit industry to the extent of appointing such a necessary officer. The growers of every county should insist upon this, and if it can be secured in no other way, should go to the poles and elect men who will protect their interests.

## Green Manuring

COVER CROP conditions confront orchardists in different parts of the state. The only intelligent method is to study these different conditions and raise the crop and plant it at the time and in the manner that these conditions require.

In general it may be said that the best crop for your conditions is that which will produce the largest tonnage. The difference in nitrogen gathering capacity amongst the legumes is exceedingly slight. Therefore, if vetch, which seems to be a favorite with many of our contributors, produces the greatest tonnage, that should be the plant chosen. If twelve to twenty-five tons of green stuff can be turned under the soil each year, it goes without saying, even if it is largely composed of water, that the chemical processes set up in its decay can only be beneficial.

## Important if True

THERE has been considerable talk in some sections of California regarding state division, occasioned by the action of the state board of equalization in raising the valuation of certain counties from twenty to a hundred per cent.

Prof. Wickson, head of the Agricultural College of the State University, in a recent article says: "What a silly thing it becomes, then, for a single county which has not paid its share of state taxes hitherto, to propose state division as an escape from its proper punishment!" That statement is most important if true, but it is the first time we have seen it asserted that the action of the board of equalization was intended as a "punishment."

The Cultivator questions as to whether the great state of California should be divided. There is along many lines a oneness of thought and a patriotic feeling which will make, we hope, many people in the south debate long before fully deciding upon separation, but the charge made by Prof. Wickson is a serious one, and we trust he will prove his statement or modify his charge.

## Stand Patters

ON one day recently two growers of different farm products dropped into the editorial room and each without knowledge of the other's statement, remarked that the producers will not stand by their agreements to co-operate in marketing their output. The industries represented by these two men were walnut and poultry raising. Both have been connected with co-operative organizations and both have found that under pressure of a good offer for their produce, the members will ignore their promises. Usually this is done by the small growers, who, while they have much loss to lose in one sense, have much more to lose in another, and who, because of the immediate penny gain, jeopardize the dollar a little farther beyond.

No co-operative effort can succeed until our producers become intelligent enough to see that they must stand together, not only when things are going smoothly and in favor of the individual, but as well when the large buyer comes along and offers him a reward for desertion. Large buyers usually have long purses and can worry the small producers apart and gain thereby. This has been the case since time began and will be, we fear, for years to come.

## The Census

THE U. S. Director of Census has requested the farmers over the country to assist in securing accurate data for the coming census by keeping records of all agricultural transactions through the year. The twelfth census reports a total investment of over five billion dollars in manufactures and over twenty and a half billions in agriculture, or more than four times as much in agriculture as in manufactures. It also shows 5,700,000 farms, and it is expected that the coming census will show about 6,000,000. In order to make the great fund of information in regard to all these farms as exact as possible, the census officials have asked the assistance of the farmers themselves.

## Scratchiculture

AN EASTERN paper has coined the new word given in the above head, which is descriptive of much orchard culture, even in California where we boast of more advanced horticultural methods than any other state of the union. Some engage in such culture because of a belief that it turns less moist soil up to the air to be dried out and disturbs the roots less, and imagine they have good reasons for their methods of work. More often such culture is the result of simon pure laziness or the keeping of such light teams and tools that deep and thorough work cannot be done. But if any place in the world is benefited by deep and thorough cultivation it is the orchards of this state. Almost invariably the big and profitable crops of oranges, peaches, apricots, or whatnot are produced by orchards cared for by the man who does not follow "scratchiculture" but does follow deep and thorough tillage of the soil.

NOT content to allow the people of the Inland Empire to have the only national or international apple show, the people of Colorado are now coming forward with the announcement that the Colorado National Apple Exposition will be held early in January. The apple has been intimately connected with the life of mankind since earliest history. It is proper to encourage it but the "nationalizing" of every show which a community may get up has little to do with the advancement of the industry.

# Agricultural News Notes of the Pacific Coast

## Northern California

Red mite has caused much damage in the bean fields of Butte county.

Numerous arteslan wells have been sunk in Surprisc Valley, Modoc county.

The sale of livestock at the state fair is said to have been a complete failure.

Anderson's shipments of fresh deciduous fruits during August aggregated 101 cars.

Ten carloads of cattle were shipped from Gridley, Butte county, in one shipment recently.

Alexander Valley in Sonoma county is now receiving fifteen dollars per ton for wine grapes.

The Fairoaks Fruit Co. has been awarded gold medal for olives and olive oil at the A-Y-P Exposition.

The cannery at Gridley made a straight two months run and closed two weeks earlier than in 1908.

The owner of a twenty acre vineyard at Woodland turned 100 hogs into his vineyard to gather the crop.

The Ehmann Olive Co. of Oroville was honored by the A-Y-P Exposition in the award of highest place for olive oil.

A meeting of the farmers of Macdoel, Siskiyou county, was held last week and methods of culture discussed.

Some farm lands in Modoc county are reported to have produced 70 bushels of wheat to the acre this year.

The big dam on the Orland Irrigation Project is under way, the foundation being over 45 feet below the surface.

The Sacramento Valley Sugar Co. at Hamilton City, wins the gold medal for high-grade sugar at the Seattle Exposition.

The State Game Farm recently established near Haywards is now said to have more than 4000 rare game birds.

The best sweet pea expert in the United States is said to be a Santa Rosa pastor and his advice is sought by the largest seed houses of the east.

The big Pittsburg syndicate which recently bought so much land in Glenn county has bought several thousand additional acres in the past few days.

One company at Nord, Butte county, will market over 2000 bales of hops this season. It is expected this output will bring the company nearly $100,000.

The Department of Agriculture has sent its portable pre-cooling plant to Lodi where it has been used in experimental pre-cooling of grapes before shipment.

Humboldt county people propose to have a well constructed highway from Eureka through Mendocino, Sonoma and Marin counties to San Francisco Bay.

Experiments made by Prof. A. V. Stubenrauch and his crops of helpers working with table grapes ln Lodi and surrounding sections have proved conclusively the gain in careful packing.

## Central California

Turlock has a thirty foot tomato vine.

Lodi ships fifty cars of tablc grapes daily.

Fresno County Fair will open October 18th.

Hanford reports raisins as drying rapidly and the fruit of fine quality.

The raisin market is still dull and producers are uncertain what steps to take.

The Stanislaus county Board of Trade has recommended a good roads campaign.

Delano, Kern county, has nearly 64,000 sacks of wheat stored in her warehouses.

A county convention of farmers unions will be held in Los Gatos October 2nd.

Santa Clara Valley poultry people are making an extensive display at the A-Y-P Exposition.

A Kings county rancher has made some trays from cottonwood this year and finds they work very satisfactorily.

The Forestry Society of California wishes to know where the three largest eucalyptus trees of this state are located.

There is talk amongst the farmers unions of endeavor to get the entire state together in one central marketing organization.

California has already shipped its first cargo of California grown hemp. It was grown on the islands of the San Joaquin Delta.

The farmers union at Campbell now has a dryer running on prunes and the union is grading and packing some fine stock.

Work will be begun on the Pajaro Valley cold storage plant early the coming winter and it will be ready for the next year's crop.

A dairyman at Riverdale, Fresno county, has a dairy of nineteen grade cows which yielded $117 worth of butter for the month of August.

A change has been made in the weather man at the Fresno station. The new officer in charge will be W. B. Fuller formerly of Los Angeles.

Swect potato growers in the Turlock section have formed a co-operative organization and agreed not to sell at less than a dollar per hundred.

The Tulare County Eucalyptus Co. has filed articles of incorporation. The purpose of the company will be to engage in the growing and selling of eucalyptus trees.

The great Chowchilla Ranch on the West Side has been bonded to a San Francisco company and it is expected that the 108,000 acres will be sub-divided and sold in parcels.

A special tax election calling for $89,000 for maintenance and repairs of the Turlock Irrigation District was held last week. The proposition was carried by a large majority.

A farmer at Pullman, Wash., has suggested to grape growers in the San Joaquin Valley that if raisins are being fed to hogs and stock, there should be some means by which farmers of the far north might have those raisins in exchange for barley for the hogs.

## Southern California

Orange county ls taking up a vigorous campaign for good roads.

The Fullerton-Placentia orange shipments last year aggregated 1136 cars.

Walnut packing houses are busy bleaching and sacking this year's crop.

The Imperial Co. farmers union held a meetlng at Brawlcy last Saturday.

Huntington Beach, Orange county, has a factory for producing fertilizer from peat.

Santa Barbara county will ship about 115 carloads of walnuts, twelve tons in each car.

Walnut growers have fixed a price of eleven and a half cents on this year's walnut crop.

The Lima Bean Growers Association has opened an office at 140 Franklin St., New York.

Covina has a newly organized chamber of commerce to push along the good points of that valley.

A large number of transfers of real estate have been made near Santa Maria, Santa Barbara county.

The average yield of sugar beets on the Orange county peat lands is about twenty-two tons per acre.

The lima bean growers are contemplating shipping beans by water this year to Atlantic Coast points.

An Anaheim farmer recently lost three good draft animals through feeding partially decayed potatoes.

Orange county proclaims that from an agricultural standpoint it is the greatest little county in the United States.

Ventura county papers are appealing for a county fair and it is possible another year may see one in that county.

A great body of land in the San Fernando Valley has been sold to Los Angeles capitalists and it is reported will soon be sub-divided.

A mass meeting of lima bean growers was held at Oxnard last Saturday The association requests that no grower sell for less than $3.75 per hundred weight.

Ventura county bean growers are standing together in spite of an effort on the part of large buyers to bear the market and break up the organization.

A fig grower in Orange county who had valuable Smyrna trees which never ripened their fruit, introduced the fig wasp this year and as a result harvested a large crop of fine figs.

A meeting of farmers and stockmen of Ventura county will be held at Ventura next Saturday to organize an association for the protection of all stock owners against stock thieves.

The almond crop of Ventura county is reported good and prices fair. Some ranchers have contracted at ten and a half. There has been difficulty in getting sufficient help for picking.

The Santa Ana River Development Co. and the Anaheim Union Water Co. have entered into an agreement with the Riverside Water Co. as to division of water rights in the Santa Ana River.

## The Coast

President Taft visited the A-Y-P Exposition last week.

Hawaii produces about 521,000 tons of sugar per annum.

Colorado will produce over a million and a half tons of hay this year.

Three thousand acres will be set to orchards in one body in Lynn county. Oregon.

Interest in the Colorado Apple Show to be held in January is increasing.

The total attendance at the Interstate Fair at Spokane this year was nearly 104,000.

James J. Hill predicts that Montana will yet be the greatest grain state in the country.

Seattle recently received 51 cars of potatoes in one day and buying price dropped to $12 per ton.

In Hawaii 2000 pounds of sugar is reckoned as a ton. In other sections 2240 pounds are required.

An immense crowd witnessed the recent opening of the great Gunnison Tunnel by President Taft.

Farmers of the Inland Empire. Eastern Washington, are already seeding for the coming wheat and grain crop.

Oregon walnut growers report the appearance of blight similar to that which has affected walnut trees in Southern California.

Fort Collins, Colo., enjoyed what was called a Lamb Day. Barbecued mutton and a general good time were the principal features.

The Hawaiian sugar fiscal year begins with the 1st of October. There are 48 complete sugar mills operating in the Hawaiian Islands.

Arrangements are practically completed for the opening of the Dry Farming Congress which will be held late in October at Billings, Mont.

Reclamation work in Arizona has been stimulated by the cooler weather, and 300 men are now at work on the Yuma Indian Reservation.

Buyers in the Oregon prune growing section seem to be backward at purchasing at prices for which producers will sell. The crop as a rule has been heavy.

A convention of apple growers will be held at Spokane, Wash. November 16th to discuss the La Fean bill which proposes a change in the size of apple boxes.

Pres. Taft's speech at Spokane on the reclamation service brought out the point that he would recommend a bond issue for advancing reclamation work.

Lewiston, Idaho, has been predicted as the center of one of the greatest dairying interests of the United States by the dairy professor of the University of Idaho.

Capitalists from Holland have been investigating the land in vicinity of Columbia, Wash., and are contemplating a project calling for the irrigation of 8000 acres of land.

Hay in North Yakima section, Eastern Washington, is held at more than double the price of former years. Stockmen who were compelled to begin early feeding because of snows have balked at paying such prices.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

## FOR MOULTING HENS

***Feed***

# MIDLAND

## Poultry Food No. 4

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

## Petaluma Incubator Company

**Petaluma, California**

Our General Agents for Incubators and Brooders and Midland Poultry Food:
**Petaluma Incubator Co., Petaluma, Cal.**
**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**

## White Leghorns

**A Standard Strain of Great Layers**

With our Standard Strain as a foundation and with the ideal conditions that exist at the Model Poultry Farm we have produced a flock of birds this season that for beauty and utility can not be surpassed.

Eggs, Stock and Chicks for sale. Send for descriptive circular of our Stock and Farm.

Address

**Model Poultry Farm** IRVINGTON, ALAMEDA CO. CALIFORNIA

## MRS. C. D. HUBBARD'S WHITE WYANDOTTES

Eggs for hatching September 1st '09. Write for circular.

BOX 60, ROUTE NO. 7 SAN FERNANDO CAL.

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

## COMMERCIAL POULTRY CULTURE

By Bee Josephine O'Mealey.

NOT only California, but all the rest of the world, is full of people energetically chasing the elusive dollar down any avenue or by-path which seems to promise pay-dirt. Many of them are without road-maps or a clear idea of the topography, but they are chasing just the same and the Chicken Cross-cut is worn by many trampling feet, many of which, alas, fail to reach the desired goal. Many people are sure there is money in poultry culture because they have sunk a good bit in it themselves, but the truth remains, there is a good bit of money to be secured in this way, under proper conditions.

### Radium to Radish.

To the beginner, who has no knowledge of chickens other than the memory of what "mother used to have," let me say, Don't take the advertisements of the incubator manufacturers too literally. A hundred eggs from a huckster wagon might produce 98 good, strong, thrifty chicks, but it's radium to radish seed that they won't. You may possibly buy a dozen hens at the meat market which will produce four thousand, two hundred and one eggs in a year with no labor and no out-lay except forty nine cents for tarred paper, but, if you do, keep those hens in a safe deposit vault and when they die of old age have them nicely mounted and present them to the leading museums of the United States.

### Common Sense.

The immutable truth is that you cannot expect something for nothing, and there is no enterprise under the sun in which you can embark and reap a fortune without investment and persistent attention.

Chickens, in common with all living creatures, require good, suitable and sufficient food and comfortable quarters, and intelligent care; common sense should teach one this, yet common sense seems to desert a great many people when they contemplate the poultry business.

### About a Thousand Head.

A shrewd, capable woman of my acquaintance helped her husband to amass a very comfortable fortune in the jewelry business. One day she told me of their plans: "We are going out of business; we can get along without earning every day. John's health is failing and our investments will keep us. We shall go out a few miles from the city and buy a little place and hire a man to raise garden truck for the market, and we will get a few chickens—about a thousand—which John will care for, just to let him feel that he has some little thing on his hands and keep him from being entirely idle, which would be bad for him."

I assured her that with a thousand chickens he would not lack for employment, but she refused to listen to my statements. A few weeks later I asked her when they were going out of business, and her manner was fairly tragical as she told me of a vacation spent in the country where the woman had only a hundred chickens, but she had to feed some of them four times a day, and had to have wire yards and machinery to hatch them and keep them warm at night, and buy stuff to kill bugs on them, and then sometimes they don't lay eggs. She had no idea that chickens cost anything for equipment or care, and yet she was a good business woman.

### Went Fishing.

Another young couple of my acquaintance set 240 fancy eggs in an incubator, cared for it every day until they were due to hatch, then, having read that the young chicks needed no food for twenty-four hours they reasoned that the incubator would keep warm if the lamp did go out. So they locked up the house and went away to stay over Sunday. They had such a fine time they did not get back until Tuesday and found about two hundred chicks, an unusually good hatch, all dead.

Another man of my acquaintance went fishing one nice hot day at the close of a 300-egg incubator hatch. When his mother learned that he was gone the thermometer stood at 120 degrees, and the brooding of that hatch offered no problems.

Unless one is willing and able to spend some money and a great deal of time and effort, the raising of poultry offers no avenue to prosperity.

The glowing stories of those who raise a few hundred chickens on the back porch of the flat or in the city back yard during the spare hours left in working in an office or at a shop are mostly practice work by those who are training for press agents or real estate boomers. And it does not follow that because one has gratifying results from a dozen fowls, fed chiefly on table scraps and waste from the family kitchen, and the kitchen next door, that one can embark in commercial poultry culture to good advantage under the same conditions; and the fact also remains that large flocks do not give as good returns proportionally as small ones. My personal experience has been that there is more money to be had from twenty fowls than from forty, not more in proportion, but actually more money.

There are numerous ways of saving one's money and energy which come by experience, your own or other peoples', and there are plenty of reputable publications which devote much space to this very experience which is of great value to the experienced and inexperienced alike, but in even the most carefully edited columns are sometimes to be found the veriest nonsense. Whatever you read or hear must bear the test of common sense and unless you can apply this test past up the chicken business.

## POULTRY STATION.

Poultry raisers of the State will be interested to know that a poultry station will soon be installed on the University Farm at Davis. Several new ideas in brooders, poultry houses and runways will be tried out. To insure immunity from poultry diseases, not a fowl will be brought to the University Farm, but all the stock will be hatched on the spot. One feature of

the station will be an isolated poultry hospital, to which diseased fowls may be brought for diagnosis and treatment.

Professor M. E. Jaffa, who has had charge of the Petaluma Poultry Station, will direct the poultry work on the Farm. Experiments in poultry feeding will be an important part of the work.

It is Professor Jaffa's idea that both the Petaluma and the University Farm Poultry Stations are needed by California poultrymen. Results obtained at Petaluma are valuable for the Bay Region, with its peculiar climatic conditions; but for the interior of the state another station is needed. The University Farm at Davis is thoroughly typical of the Great Valley in every way, and the poultry station there will complement the work of the Petaluma station.

## GOOD DUCKS.

Mrs. D. F. Ulery of Artesia started this spring with four white Pekin ducks. From these she had raised up to the first of July, one hundred and forty-three, besides some that died and two settings that were sold. Of this number she has sold one hundred and eight, many of them at ten weeks of age, averaging about fifty-one cents each. Their principal feed was bran and skim milk, together with grain and abundance of green feed. Mrs. Ulery has a hobby about watering, and instead of leaving water about for the ducks to run to at any time, gives it to them three times a day. She keeps them closely confined all the time, and finds that they are easy to raise and profitable, especially where they can have access to abundance of skim milk.

## POULTRY QUERIES.

### May Be Chicken Pox.

I have a turkey with head and neck and also all over her body swelled very badly and she has been that way for over a week now. She eats well, is lame.—K. E., Loomis, Cal.

This is a difficult case to diagnose. If the nature of the swelling were more explicitly explained it would be an easier task to discover the cause. There is a disease called wind-puff, which will cause a swelled appearance sometimes covering the whole body, and which may be cured by pricking the skin in different places, carefully, and letting the air out when the skin will go back in place where it belongs and the bird be entirely relieved, although it may swell up again to some extent, when the same treatment will relieve in the same way.

If the swelling was in the form of small lumps, I should suspect chicken pox and advise the free use of camphorated lard or carbolic ointment twice a day, with nourishing and easily digested food, and a teaspoonful of sulphur and some chopped onions once a day, until cured. Keep separate, as chicken pox is very contagious and young birds especially liable to catch it.

After using the greasy ointments a few days, it is advisable to wash well with warm soap-suds in which a few drops of carbolic acid have been dropped, say ten drops to a half pint of the soapsuds.—Mrs. F. M.

### Worms.

We have been fattening two month old Leghorn roosters and I killed one today and in cleaning it found a white worm about three inches long in the intestines. What do you think caused this and what can we do if other chickens should have them? We are inexperienced in the chicken business. Sincerely C. J. W., Pomona.

Chickens, like children, will get worms, and it's hard to tell just how. The round worm is the kind chicks have, and while a few will not seri-

(Continued on Page 359.)

**Coulson's EGG FOOD**

At this time of year the hens are apt to begin falliug off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

# CONGO
## NEVER LEAK ROOFING

WE OFFER to the consumer the best Ready Roofing proposition on the market to-day. We don't make Congo just to sell to a floating kind of trade and then forget about you.

We make Congo *to wear*—to give satisfactory service. We not only want your trade, but your good will. We want every buyer of Congo to be a *satisfied customer.* That's our best advertisement.

To this end we have made Congo just as good as a ready roofing can be made. We have tested it in every possible way, and by long continued service. We are so satisfied that Congo is the longest wearing ready roofing on the market that we have made arrangements with the National Surety Company to issue a Guarantee Bond *with every roll of Congo.*

These bonds cost us money, but they add not a cent to the cost of Congo to you.

Before the National Surety Company would assume this responsibility, they convinced themselves beyond a reasonable doubt that Congo would do all we claimed for it. And there isn't another Ready Roofing on the market to-day that carries a like guarantee.

Don't you think that a roofing in which the manufacturers show such confidence is worth investigating?

Send us your name and address and we will mail you a Congo sample free with our booklet telling all about it.

# Irrigation and Forestry

### A STORY IN PICTURES.

The following engravings taken from "Conservation of Resources in California" which is a part of the Twenty-Third Biennial Report of Edward Hyatt, Superintendent of Public Instruction, gives a forceful illustration of need of storing the floods. This is a most acceptable move on the part of the leader of our educators and we trust will be fully supported.

"It is safe to say that the prosperity of our people depends directly on the energy and intelligence with which our natural resources are used. It is equally clear that these resources are the final basis of natural power and perpetuity. Finally it is ominously evident that these resources are in the course of rapid exhaustion."

A hundred acres of good land made worthless by flood. Orchards smothered and fence posts covered by sand.

As a result of deforestation of the hills above, a little stream swells into a torrent and the rich bottom landsare carried away, leaving only boulders and gravel.

A truck garden ruined by flood. The fertile soil carried away, leaving gullies in some places and piles of gravel and driftwood on others.

# General Agriculture

## PARA GRASS.

We recently had the pleasure of inspecting a small patch of the so-called Para Grass which has been reported as producing such exceptional quantities of forage and hay. Mr. Metcalf of Los Angeles has tested it out both in the city of Los Angeles and on lands in the Imperial Valley. From these tests Mr. Metcalf feels positive that this grass will produce at least ten tons of hay per acre per cutting, growing two cuttings per year. While analysis shows the hay by no means the equal of alfalfa, it is rich in protein and apparently will make a rich stock food. We have never heard the opinion of the stock on this hay, that is, as to whether it is eaten up clean or not, but if it proves acceptable to the animals, it promises to bear such crops that it will be grown where conditions are right for it. It is not a water plant, but it requires plenty of moisture. Therefore, it is not adapted to arid conditions, but for those who have swampy or naturally moist lands we should consider this grass well worth investigating.

The proper name of the grass is panicum muticum though it is often classified as panicum molle.

Mr. W. B. Thomas of Wahiawa near Honolulu, Hawaiian Islands, sends the following account of its worth in the islands.

### Para Grass in Hawaii.

The Cultivator stated in a recent issue that Imperial valley farmers were experimenting with Para grass (Panicum Molle.) About eight years ago Prof. Koebele, brought to these islands from Fiji a small bundle of cuttings of this grass, part of which the writer secured and the balance was planted in the Government nursery grounds. Now it is grown by practically every farmer in the islands and is almost the only fodder grass grown. The value of this crop to the islands is hard to estimate, as hay cannot be successfully grown and cured here, but has to be brought from the coast at a cost of from $30 to $35 a ton.

Last January we planted about 1¾ acres of it from cuttings and May 22 began cutting it. It then stood five feet high and ran 15 tons to the acre. We only cut enough each day for that day's feeding. August 13th we finished the block, and the next day began the second cutting, with a stand equally as heavy as the first. We fed from it 12 to 16 horses and mules and three cows and were not very careful about wasting it. We feed nothing else except rolled barley and our animals keep in prime condition and work hard every day.

If given room this grass will run along the ground and take root from the joints, and in order to get an upright convenient crop for cutting, it should be planted close. After preparing the land, we plow a furrow and put six to eight cuttings in a bunch every foot or so, then run another furrow close enough to at same time cover the first row, and so on. We use cuttings twelve to fifteen inches long and leave part above ground.

While Para grass will grow fairly well with a moderate amount of moisture, to get a big crop it should have frequent rains or irrigations.

---

A light top-dressing of manure after sowing, or, in case of fall sowing, any time during the winter, helps to conserve moisture as well as to give the growing plants some nitrogenous food. Applying a top-dressing of stable manure at least every second or third winter is certain to prove profitable. If it contains coarse straw or other litter, this should be raked and hauled off later, but before the alfalfa grows too high, especially if the hay is intended for the city market. Many successful growers in Kansas, who claim to cut from five to seven tons of alfalfa hay per acre in a season apply a top-dressing of manure every winter. The highest yields reported from eastern states are where this practice is followed. Some experiment station men believe that where this is not done the crop will after eight or ten years tend to impoverish the land instead of further improving it.—From Coburn's "The Book of Alfalfa."

# Queries and Replies

**Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Gum on Peaches.

I have had trouble with gum exuding through skin of peaches, also showing more or less over the tree. What is the cause and remedy?—T. S. B., Porterville.

The gumming of the peach is not of regular annual occurrence. Some seasons it is hardly noticeable, while at other times the fruit is affected badly. The cause is present when the fruit is yet green and in the growing stage. Any injury to the skin, such as sting of insect or growth of fungus that hardens and cracks the skin will cause it. Sometimes it will extend to the pit and at others only part way. Lime, salt and sulphur spray late in the winter is the best remedy. This wash destroys spores of fungus and is at the same time a most excellent insecticide.—J. W. M.

### Apricots on Almonds.

Is the almond disirable as a stock on which to bud Royal apricots? Will they ripen any earlier on such stock? If so, how much earlier?—B. E. S., Pomona.

They will not ripen earlier, and many orchardists have formed a definite opinion that the almond root is not desirable for budding apricots. The proper affinity does not seem to exist. The almond does well on its own root.--J. W. M.

### Cement Floor for Stable.

Please tell me how to lay cement floor for cow stable. How shall I mix sand and cement and how shall I prepare the ground?—A. K., Selma.

If the soil is gravelly thorough tamping will put it in condition to be overlaid with concrete. If clay, it should be dug out for about six inches and filled in with gravel or gravelly soil and thoroughly tamped. If soil is clay or tends to hold considerable moisture, you should construct a blind drain of coarse gravel or boulders leading out from under the floor.

For the construction of the ordinary stable or barn floor, which is not to carry any great weight, the following proportion is to be recommended for the concrete base: 1 part cement, 2½ parts clean, sharp sand, and five parts of loose gravel or broken stone. Thoroughly mix, moisten and tamp. This should be finished on the surface with a 1 to 1½-inch layer of a mixture of 1 part cement and 1½ to 2 parts of clean, sharp sand. The total thickness of this floor must be from 5 to 8 inches, depending upon the load it has to carry.

### Gooseberries.

I have three year old gooseberry bushes which show fine growth and look healthy, but do not bear. How should they be pruned?—J. S. B., Compton.

The gooseberry which will do well in the vicinity of Compton, has not yet been found. In fact, nurserymen have long been seeking to find a gooseberry and currant which will bear in that locality. We have been informed by a nurseryman near Los Angeles that he is now experimenting with both gooseberries and currants and has had a measure of success in inducing them to produce, especially in the case of the currants. He has this year some exceptionally fine fruit in sufficient quantity to be profitable. We hope these experiments will be continued until plants are secured which will produce commercial crops. Until that time we do not think our Compton subscriber can make his plants bear by any method of pruning which he may follow. Climatic conditions there are not favorable to that fruit.

### Lupine Seed.

Please tell me where I can secure lupine seed, what is the price, and what amount should be sown per acre?—Subscriber, Hemet.

Lupine seed can be secured for you by any of the seedmen advertising in the Cultivator, at about $9.00 per hundred. It is far more expensive than vetches or peas and they are usually preferred for green manuring. If that is the purpose for which you wish it, it would require 75 pounds per acre in field or 50 pounds in orchard.

### Draft Horses.

Where is the most reliable draft horse stock farm, and about what is the price of such horses?—Subscriber, Hemet.

J. Crouch & Sons of Sacramento are importers of fine draft animals as is also the Lafayette Stock Farm at San Jose. A young draft team will command from $500 up.

### Sour Soil.

How can I correct the condition of soil in my garden which is full of sorrel and not in good shape for ordinary planting?—T. A. K., Bridgeport, Conn.

Application of lime is desirable for such land. If in bad condition, 1000 or even 2000 pounds of sugar factory lime is often used. If you cannot obtain this form of lime, the ordinary air slacked should be applied. It must be well slacked, however, as quick lime is too caustic. We would prefer to make an application of about 500 pounds per acre to be followed by a second if needed. Plowing under of stable manure and thorough tillage to allow air to penetrate soil will also prove very valuable. We note that farmers in many Eastern states are applying ground, un-

**70c up to $4.25 Buys the Most Useful Article Any Farmer Can Own**

It is the great **Burr Automatic Safety Tackle Block**—the one rope tackle block that does a chain block's work. One man can do the work of four in changing wagon boxes, lifting injured animals, stretching wire fences, and many other farm jobs that need strength. It has no teeth, wedges and eccentrics to bite, tear and wear rope. It locks unfailingly and holds firmly and safely on greasy and wet rope, and in any position—even up side down. The simplest, strongest, handiest farm help ever invented. You couldn't afford to be without it if it cost twice the money. Capacity, 800 up to 5,000 lbs. Write today for catalog and complete instructions.

**BURR MFG. CO.**
158 Viaduct, Cleveland

Pacific Coast Agent—American Fence Construction Co., Stockton, Cal.

burned lime rock to benefit such soils.

### Forage for Dry Land—Eucalyptus.

I am located in Ventura ten miles from the coast, where we get plenty of rainfall in the winter months and have range of temperature from twenty-five to one hundred degrees. Soil is dark colored, hard to work but very rich, and makes good crops of hay, grain and corn, without irrigation. Would it be advisable to plant alfalfa without irrigation, seeding in rows so as to allow of cultivation? If this would not pay, what other perennial forage plant is desirable? What kinds of eucalypts would do well under same conditions, to make hard wood, be used for fence posts, etc.?—S. B. W., Ventura.

The first question is an extremely hard one to answer intelligently without knowing sub-soil conditions, distance to water, and other factors which determine crop successfully grown. We do not think alfalfa planted in rows and cultivated would pay under the circumstances. The desirable forage plant which will do well under these conditions is what the state has been seeking for many years. If your soil will grow a fair crop of corn, we believe that alfalfa would be as satisfactory a crop as could be planted. It would probably yield two cuttings in the springtime and considerable pasture through the summer, but, as we said, sub-soil conditions will govern.

The blue gum, or eucalyptus globulus, would doubtless be the best tree for your conditions. If you never experience a temperature below twenty-five degrees, it would be almost perfectly adapted to your situation and yield a profitable crop. It is proving a most valuable hard wood.

### Brome Grass.

What are the bad qualities of Bromus Inermis? The seedsmen unite in extolling it, but the subject would be more complete if we had the growers' experience. If it is what is claimed, it is of sufficient value that it should be better known.B. J. O'-Mealy.

Brome grass has been used largely in Europe for a forage grass. It has been planted to a limited extent on the Coast. We will be pleased to give opinions from those who have tried it.

### Bermuda Grass.

How can I get rid of Bermuda grass? Is there a quicker way than drying it out? If the land is sub-irrigated, then what method can be employed?—A. L. S., Imperial.

The only way to get rid of Bermuda grass is by thorough and deep cultivation continued through the season. That is the only way we have found that is satisfactory. Of course, the chemical process can be used, but it is expensive and destroys the land for other plants for a period of time. Where the Bermuda is in alfalfa field or crop of that kind where it cannot be cultivated out, we know of no other way than to rotate crops, giving clean cultivation till it is disposed of.

### Pickling Olives.

In what month are green olives gathered for pickling, and when the ripe ones?—L. H., Creston.

This depends upon the variety and somewhat upon the season, pickers pick according to coloring and not by date. Those who grow the Mission variety prefer to allow the olives to color slightly, that is to show a purplish tinge. The fruit is then firm and contains a large percentage of oil and is in proper condition for pickling. The Mission olive is a rich dark purple when ripe. Experience will very quickly teach you when to pick the ripe fruit. For directions as to curing, see Citrus and Sub-tropical page of next issue.

### Unruly Cow.

We have an opportunity to buy a good milch cow because owner cannot keep her inside of fence. Her yoke does not prevent her from vaulting any fence. Is there any way of controlling her? We have young heifer with second calf which shows no sign of coming in heat. Can you suggest remedy?—Subscriber, Arroyo Grande.

Set upright poles at opposite sides of the corral, of equal height and strong enough to carry a wire cable. Place a small trolley wheel on the wire and attach cow to it by ring in her nose. The ring is much safer than rope around the neck. The rope from trolley should only be long enough to allow the cow to lie down, as if too long, she will get tangled in it.

The trouble with the heifer should be treated by a veterinarian, for if one did not understand the conditions, the trouble might be made worse.—M. E. S.

### Melons for Cow.

Can you tell us how cow melons (citrons) affect the milch cow? Can they be fed seeds and all with benefit?—S. R., Hemet.

Cow melons are valuable for succulency and will add to the milk flow considerably when the cows are on hay or dry feed. While their nutritious value is not high enough for them to be considered as of much worth for the solid part of a ration, they do afford the watery portion that brings back the hay to a nearly grass condition. The seeds are not injurious and we never trouble to remove them.—M. E. S.

### Olives.

I should like to know about how much olives will pay per acre. If you care to do so, I shall be greatly obliged if you will give me your past experience on that point. I should also like to know what varieties seem to pay best, and how you find your market for the fruit. How soon do the trees begin to pay? How much irrigating do they demand?—W. O. S., Berkeley.

The olive bears a full crop alternate years and the off year the crop is about a fourth of the "on" seasons. The buyers seek the good orchards and there has never been any trouble in selling our crops, I believe the tales of woe we hear are from people who have ten or a hundred trees and have to take whatever they can get for the fruit as it is not enough to make the buyer eager for the lot. Our olive trees bore a $1500 crop the fifth year from planting. They have never failed to produce for the past ten years. Roughly speaking the "on" years the crops sell for from $200 to $250 an acre, the off years for $90 to $125 an acre. While the trees were young they were irrigated three times during the summer and kept in constant cultivation. Much of our land is rough and the trees were watered with cart. Some blasted as the hard pan was on the surface. After the trees are five years old we irrigate them in August to secure a swelling of the berries. We are intending to plant another orchard as fast as we can grow the trees for it, for we want only the offspring of the trees that have proven productive on our soil and under our cultivation methods.—M. E. S.

# Classified Liners

Rates 1½ cents per word per issue No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

## RUBBER STAMPS.

SEND IN YOUR ORDERS FOR RUBber stamps, dies, stencils, etc. Catalogue on request. F. W. HOPKINS PTG., CO., 641 S. Main St., Los Angeles, Cal.

REGISTERED BERKSHIRE AND POland China hogs, both sexes. C. A. STOWE, Stockton, Cal.

Mayer Special Merit SCHOOL SHOES

"WEAR LIKE IRON"

They wear best where the wear is hardest. Made of selected leather specially tanned to resist exactly the kind of wear a healthy boy or girl will give them.

Two layers of leather are sewed in at the tip instead of one, to prevent the toes kicking out. The soles are of extreme toughness.

Mayer Special Merit School Shoes

are made to fit a child's foot in a comfortable, natural way that will prevent foot trouble in later years, yet they are stylish and good looking. Only the genuine have the Mayer Trade Mark stamped on the sole.

FREE—If you will send us the name of a dealer who does not handle Special Merit School Shoes, we will send you, free, postpaid, a handsome picture, size 15x20, of George Washington.

We also make Honorbilt Shoes for men, Leading Lady Shoes, Martha Washington Comfort Shoes, Yerma Cushion Shoes and Work Shoes.

### THE ENGLISH LANGUAGE.

A pretty deer is dear to me,
A hare with downy hair,
A hart I love with all my heart,
But barely bear a bear.

'Tis plain that one takes a plane
To halve a pair of pears,
Although a rake may take a rake
To tear away the tears.

A scribe in writing right may write
To rite and still be wrong;
For rite and write are neither right,
And don't to right belong.

Beer often brings a bier to man,
Coughing a coffin brings,
And too much ale will make us ail,
As well as other things.

The person lies who says he lies
When he is not reclining;
And when consumptive folks decline
They all decline declining.

Quails do not quail before a storm,
A bough will bow before it;
We cannot rein the rain at all,
No earthly power reigns o'er it.

The dyer dyes a while, then dies—
To dye he's always trying;
Until upon his dying bed,
He thinks no more of dyeing.

A son of Mars mars many a son;
All Deys must have their days;
And every knight should pray each night
To him who weighs his ways.

'Tis meet that man should mete our meat
To feed one's fortune's sun;
The fair should fare on love alone,
Else one could not be won.

Alas, a lass is something false,
Of faults a maid is made;
Her waist is but a barren waste,
Though stayed she is not staid.

The spring shoot forth each spring and shoots
Shoots forward one and all;
Though summer kills the flowers it leaves
The leaves to fall in fall.

I would a story here commence,
But you might think it stale;
So we'll suppose that we have reached
The tail end of our tale.

---

### WHEN COMES YOUR TURN.

THE man who sits at the desk in front of mine and pounds a typewriter which is entitled to the respect we accord vigorous old age writes a screed to fill this space, or some other space, every two weeks, and I, as you may have observed, alternate with him. Dear, dear, but I am tickled when his turn comes, for the article means extra work, and extra work and I are not friends, never speaking as we pass by each other if we can help it. When his turn arrives I look at him across my table, and say:

"Aha! It's your turn now! Hope you enjoy it. You'll have to earn your salary this week while I sit around and watch you. I wish you joy."

Then my turn comes, and, while he is not so demonstrative as I, he says more in less words, and, oh, how his pointed remarks anent my extra stunt do cut and rankle. He is a quiet man, like Bret Harte's Mr. Brown, but, heavens and earth, children, how his words do hit the palpitating mark when he responds to the toast that I gave his extra labor the week before.

So we have it back and forth, and I can see that there is real humor in what I say to him, but blowed if I think there is anything funny about his return addresses.

I have been thus explicit in outlining our situation here because I think it forms a pretty good text for a Sunday sermon to be delivered by a parson without a clerical cravat and several other pulpit accessories. Did it ever occur to you, my brethren and sisters, how much easier it is to bear some other fellow's burden than it is to tote your own? Ah, you bet it is, Why, I would sooner bear the loads for a whole community than to carry a small one for myself, and it is the same with you.

Here is a fellow who really has been hit a pretty hard blow by fate. I realize it, and I am sorry for him. "Yes, it's tough," I say to myself, turning away from him, "still, he ought to be philosophical and, realizing that this is a world of tribulation, make the best of it. What he needs is a little philosophy." In the final analysis that is about the way I say it. Don't you?

But hard-hearted fate keeps skirmishing around, and after a while it runs across me and gives me precisely such a blow as it gave the other fellow. Now where is the philosophy of which I prated when only somebody else was involved? Gone; faded away like the dews of the morning, non est; just stepped out; not at home, and things like that. Ah, it is then we learn that our philosophy is a coat we cut to fit some other fellow's need, but it is so thin and gauzy that it will not keep a single raindrop of woe from our own persons. It is a mighty good garment to wear in fair and sunny weather, but you will do well not to trust too much to it when the clouds hang low. Of course the other fellow ought to wear it, but that is a very different matter, as anyone can see when the pain of the stab is his.

We say "too bad!" when the other chap is hurt, and the expression or sympathy is very genuine while it lasts, which it does until it is time for the theater or something of that sort. But when our turn comes, and we ourselves are hurt, well, that is a good deal more than too bad, and don't you forget it! It is real pain this time, and not the kind that some other fellow has to suffer. Did you ever notice that you never said "a big, big D" because some other man's corn was stepped on? But how often have you said, or thought, it when some clumsy wretch who deserved asphyxiation stepped on your own little pet? Quite a different case, wasn't it? Do your best, you couldn't act precisely the same in each instance. Now, could you?

Should we, then, give up the hopeless attempt to attain unselfishness? Well, we had better give up anything else first, for precisely to the extent that we earnestly make such an attempt will our lives be valuable to the world and ourselves. Hear a parable.

In the morning of life a certain youth who loved the beautiful started to climb to a distant summit, for he saw that God's spirit of light first wrote its message there in the dawn, and lingered there longest and most lovingly in the eventide. "I will go there," he said to himself, "where the glory of the white light will be most about me."

There were some who discouraged the youth, saying, "The summit is

unattainable," and yet others who told him, "We have tried, and failed," but he went his way, ever toiling upward and still upward.

And the years dragged wearily on until he who once was a youth no more was so, and still, with the strength of manhood upon him, he toiled upward, and yet upward; and the white summit still was far away, but the dawn broke earlier and the twilight lingered longer about him.

And still the years dragged on, and now he was old, and his feet stumbled often as he crept upon his upward way. The summit yet was far away, but the glory of the white light was about him through many hours when the world below him was in darkness.

And then, being old and worn, he laid him down and slept, and, sleeping, smiled. And there are those who say that a bright messenger came and carried him away to the summit where the sunlight ever smiled. But whether this be so or not, this do I know: That his life journey was far brighter and more beautiful than it would have been had he lingered in the valley where the shadows lurk.

And so ends the parable.

When comes your turn—I don't wish to make this a species of miserere, for notice this my little flock: Life is a pretty good sort of game, and our turn to have a little fun comes pretty often. To be sure, we sometimes get a plexus blow just as we were intending to laugh, but that doesn't happen so often that we need to be regularly anticipating it, as, judging by the expression of your countenances, some of you appear to be.

When comes your turn—Let's get at it in another way; say, something like the following, for instance:

### When Comes Your Turn.

When comes your turn perchance 'twill smile for you,
Or it may frown as on its way it wings,
For here's a word that you'll admit is true:
We know not well what any morrow brings;
But this we know, and this we'll say, my lad:
Though Fortune smite us till the system reels,
She cannot drive us wholly to the bad—
The soul is greater than the blow she deals.

When comes our turn—Oh, come it foul or fair,
It still shall find us standing as we may.
The burden may be sore and hard to bear.
But, faith, there's strength in even human clay.
Ah, never mind a fall, for falls don't count,
To him who, stricken earthward, upward springs.
A fall is but a place from which we mount,
For we are MEN, and vastly more than kings.—A. J. Waterhouse.

## FOR CLEANING WOOLEN FABRICS

THERE is no cleaner that can be used so safely in renovating delicate colored woolen garments as soap bark. The right way to use the bark is to make a thick lather in cold water with the hands, only a small quantity of bark being required for a tubful of lather. Add hot water till the suds is moderately warm and it is then ready for washing any delicate colored fabric, and such goods must always be hung in a shady place to dry.

Any light colored woolen garment that is not soiled enough to be washed can be cleaned beautifully with powdered French chalk, and as the powder is very inexpensive it can be used liberally. First spread the garment on a table and sprinkle the chalk all over the fabric, then brush it in the goods thoroughly with a fine brush, and when every inch of the goods has been cleaned in this way, shake the garment and brush with a clean soft brush, and press if necessary.

White woolen waists and dresses can be kept soft and white as long as they last by stirring enough pearline in hot soft water to lather freely and about a teaspoonful of ammonia. The garment must be cleaned by pressing and rubbing between the hands then rinsed in a very light suds, but a little blueing water should be used instead of ammonia. Press as much of the water out as possible and hang the garment over the line without wringing, and before it is quite dry, iron on the wrong side until perfectly smooth and dry.

All woolen goods can be washed in this way no matter what the color or how soiled the goods, only for black goods the rinsing water must be made very blue with common blueing. When pressing the goods, the ironing must be done slowly with irons not too hot nor too cold, moving them just fast enough to prevent leaving the print of the iron on the right side of the goods.

Before washing a woolen skirt, baste the pleats down carefully and they will look better and be much easier to iron smooth.—Aline.

## RECIPES.

### Rock Cookies.

Three-fourth cup brown sugar, one-half cup butter, two eggs, one cup flour, one cup stoned raisins, one-half cup nut meats, one-half teaspoon soda dissolved in a teaspoon of cold water. Do not beat eggs but add one at a time in the mixture; drop in spoonfuls and bake.—Mrs. William Bjerke.

### Raspberry Cake.

Mash raspberries with sugar and let stand an hour or two. Make a two-layer cake as follows: One cup flour, one-third corn starch, one cup sugar, one teaspoon baking powder, one-half teaspoon salt, three eggs, five tablespoons hot water, and flavor. Spread crushed berries thickly between the layers and on top. Beat the whites of two eggs till stiff, sweeten and spread on top. Return cake to the oven till meringue is a delicate bhown.

### Plum Pudding.

One cup of suet chopped fine, one cup of currants, one cup of raisins (seedless are best), one small cup of sugar, one cup of flour, one cup bread crumbs, one-half cup lemon peel cut very small, three eggs, one-half teaspoon salt, one teaspoon baking powder, onehalf teaspoon ground ginger, one-haif teaspoon ground nutmeg, or any other spice preferred; mix with rich milk to a stiff batter so that a spoon will stand upright in it, tie tightly in a cloth and boil for four or five hours. Sauce for pudding:—Cream together four tablespoons sugar, two tablespons butter, two tablespoons flour or corn starch; add a pint of milk or water and boil until it thickens. When a little cold add one beaten egg; flavor with lemon or any flavoring to suit the taste.

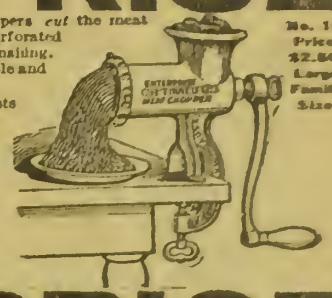
ENTERPRISE

Meat and Food Chopper

"Enterprise" Meat and Food Choppers *cut* the meat with a revolving steel knife against a perforated steel cutting plate without tearing or crushing. Easily cleaned. Practically unbreakable and will last for years.

The No. 5 "Enterprise" Chopper costs only $1.75; No. 10, shown in cut, $2.50. They are standard family size, and not only save half the work at butchering time, but are useful in the kitchen every day in the year.

Made in 45 sizes and styles for Hand, Steam and Electric Power. We also make cheaper Food Choppers, but recommend the above for the reasons given. Illustrated catalog free. Sold at Hardware and General Stores, etc.



No. 10 Price $2.50 Large Family Size

ENTERPRISE

Sausage Stuffer and Lard Press

Lessens the labor at butchering time. Two machines in one. Well made and does its work quickly and surely. Cylinder is bored true and plate fits accurately. Pressure cannot cause meat to rise above the plate. The Patented Corrugated spout prevents air from entering casing, ensuring perfect filling and preservation of sausage.

Machine can be changed into a *Lard Press* in a minute's time. Can also be used as a Fruit Press.

Your dealer will be able to supply you with the "Enterprise" Sausage Stuffer and Lard Press

No. 25—4 quart Japanned Price $5.50 4 sizes Tinned and Japanned

ENTERPRISE

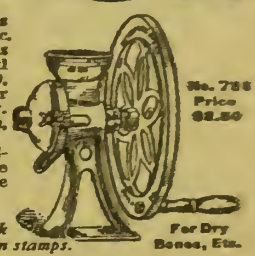
Handy for grinding poultry food and making bone meal fertilizer. Mill shown in cut $3.50, weight 60 lbs., grinds 1¼ bu. corn per hour. Look for the name "Enterprise" on the machine you buy.

Grind up dry bones, oyster and other shells, corn, etc., for your hens and watch results.

Other famous "Enterprise" household specialties are: Coffee Mills; Raisin Seeders; Fruit, Wine and Jelly Presses; Cherry Stoners; Cold Handle Sad Irons, Etc., Etc.

Sold at Hardware and General Stores, etc.

*Write for "The Enterprising Housekeeper," a book of 200 choice recipes and kitchen helps. Sent for 4c. in stamps.*



No. 78½ Price $3.50 For Dry Bones, Etc.

THE ENTERPRISE MFG CO. of PA., Dept. 55 Philadelphia, Pa.

*"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point!"*

MORE LIGHT

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

THE ANGLE LAMP

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

Boesch Lamp Co. 1135 Mission St. San Francisco

Established 1869. Incorporated 1890.

The Brownsberger

Commercial College

953-7 West Seventh St., Los Angeles, Cal.

Old .....8@10

### Honey.

White comb .....14@15
Light Amber .....10@12
Extracted W W .....7½
Extracted light amber .....6½@7
Beeswax per lb .....25@29

### Hay.

Scott, Magner & Miller say:

Recepits of hay for the six days just past have amounted to 4300 tons. These heavy arrivals, in addition to the large quantities that have come into this market during the last three weeks have proved a heavy burden to the situation at this time. The little rain that we had at the end of last week plainly showed it to be a necessity to remove the hay from the fields at once, and every effort therefore has been used since that time to do so.

The railroad yards here in the city were overcrowded with hay at the opening of the week. Our own firm alone had the large amount of 86 carloads on the railroad tracks on Monday morning.

Export shipments have been decidedly moderate, and this statement will also cover on coastwise shipments. We have had many inquiries for hay for outside shipments, and much might have been done in this direction to relieve the market here if prices throughout our markets had ranged on a lower basis, and in closer sympathy with the heavy stocks on hand throughout the country tributary to San Francisco.

Alfalfa hay is lower; the demand has not been as active as anticipated, and the supply has been exceedingly heavy, and much of the alfalfa hay is now being offered at lower prices than have prevailed heretofore.

This week's quotations are:

Choice wheat hay .....18.50@19.50
No. 1 wheat or wheat & oat 17.00@18.00
No. 2 wheat or wheat & oat 14.00@15.00
Choice tame oat .....16.00@17.00
Other tame oats .....14.00@15.00
New crop wild .....11.00@15.00
Stock hay .....8.00@9.00
Alfalfa .....10.00@13.50
Straw .....55@65

### Grain.

Wheat No. 1 .....1.67½@1.72½
Barley .....1.30@1.40
Oats white .....1.60@1.65
Oats gray .....1.60@1.65
Rye new crop .....1.70@1.75
Corn Egyptain .....1.60@1.65
Cal sm round .....1.70@1.75
Alfalfa seed, Cal. 16@18
Mustard brown .....3¾@4½
Millet .....2½@3
Flaxseed .....4
Broom corn seed per ton .....28.50

### Feed Stuff.

Bran per ton .....29.00@30.00
Feed cornmeal per ton ....38.00@39.00
Cracked corn per ton .....39.00@40.00
Rolled barley per ton .....29.00@30.00
Rolled oats per ton .....38.00@41.00
Oil cake per ton .....38.50@40.00
Cocoanut cake per ton .....25.00
Middlings .....36.00@37.50
Mixed feed per ton .....28.00@32.00
Shorts .....31.50

## Citrus Market

LOS ANGELES, Oct. 6, 1909.

There is but little interest in the orange market owing to the light shipments and to the fact that the season is so nearly ended. The few shipments now going forward are being received with rather better grace than for some time. Actual returns are but little if any greater, but the market is cleaned up quicker and is gencrally in more satisfactory condition. Daily shipments now run from twenty to thirty cars.

Lemon shipments are extremely light, some days only three to five cars going forward. Prices, on the other hand are most satisfactory and every offering is promptly picked up at full quotations.

**SHIPMENTS.**

Total shipments of citrus fruits since November 1, 1908, are 37,328 cars of which 31,289 cars were oranges and 6,039 lemons. To same date last season there were 29,022 cars, of which 24,371 were oranges and 4,651 lemons.

---

NEW YORK CITY, Oct. 4.—Fifteen cars oranges sold. Market very steady. Weather cloudy, cool and threatening.

# Scalefoe

Greatest Known Spray or Wash for Scale: San Jose, Black, Red, Purple and Brown. Also a sure thing for Red Spider, Canker Worm, Moss, Caterpillars, Lice, Codling Moth, and all Insects and Bugs that infest plant life; without injury to the plants, and with positive benefit to the soil, when applied.

This has long been the leading Spray or Wash in many sections of the country, wherever introduced. We have bought the formula and the rights for this section and are putting it out under our own brand. No article can bear the "West Coast" name unless it is the best of its kind. We guarantee Scalefoe to be just as represented. Send for circular with many testimonials.

Gallon can, 85 cents; 5 gallon can, $3.75. If not sold by your dealer will send gallon can for $1 or 5 gallon can for $4, freight prepaid by us within 200 miles. Write for price in barrels. Mix 20 parts water to 1 part Scalefoe, before using; makes it the cheapest as well as the best. Satisfaction or money back.

### HORSE CLIPPING TIME IS HERE.

The season for clipping horses is again in full swing and everything points to the fact that this practice is growing more common every season. It is unquestionably a good plan as the clipped horse not only makes a better appearance but can be cleaned in a small fraction of the time that it takes to clean the unclipped horse. Furthermore, the best horse authorities agree that it improves the health of a horse. The clipped animal dries out much quicker than the unclipped horse and gets better rest and naturally is in better condition to do its work well.

Good machines for clipping horses can be had at very reasonable figures so that even a man who owns but a few horses may clip them without any great expense or inconvenience.

# Legal Queries

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ No. Broadway, Los Angeles.

### Ditch Right.

A. sold half of his ranch to B. with water stock. After B. had irrigated three years through ditch that crossed A's place, A. ploughed up the ditch. B. has no other ditch by which to irrigate. What can B. do? The deed does not mention any ditch right. Can B. sue for damages. Can he make A. give right of way, or does A. have to sell him right of way?—Subscriber.

In all probability, B. has a right of action against A. to compel A. to permit B. to use the ditch mentioned, or to use a portion of A's place for conveying the water across it, if there is no other way by which B. can get water upon his place.

The question as to whether or not a private individual may compel another individual to give a right of way for water either by condemnation or otherwise, is very much unsettled, and probably there are very few cases in which the Courts would permit a private individual to acquire such a right of way by arbitrary methods. The facts suggested by the above inquiry indicate a case that should appeal for relief very strongly to a court. Perhaps B. could maintain an injunction against A, restraining A. from interfering with B's use of a right of way across A's place, basing the suit upon an easement belonging to B. by virtue of the fact that B's place is in law, a dominant tenement, while A's is a servient tenement, A's place having become burdened with the easement by virtue of the facts which probably exist as follows:

A. and B. dealt with reference to B's place, knowing that B. would acquire the water right in question, and would have no means of using the same except that access could be had through A's place; B. purchased, relying upon the physical conditions as they existed, to-wit, the use of A's place for conveying the water to B's place; and the knowledge that water had been so conveyed for a greater or less length of time, and the expectation that the place purchased would continue to be rendered fruitful by the use of the water.

The indications are that the case is a very interesting one and should be won by B.—E. L. P.

### POULTRY QUERIES.

(Continued from Page 351.)

ously affect the health of the chick, many will stop up the passages and cause all sorts of trouble, and finally death.

It's discouraging enough work trying to fatten a restless chick without at the same time banqueting a host of intestinal worms. Remember when "Josiah Allen" took summer boarders and the lady had a tape-worm and he wanted to charge extra for it? Said he "didn't agree to board no tapeworms, it wasn't in the bill at all." And we can't blame him. Now to get rid of them, dissolve in the water used in mixing the mash, two grains of santonin for every adult bird and one for every chick (half grown) to be treated. Mix a small amount of mash with this, quite dry and add one-half teaspoon of castor oil for each bird. Collect all droppings after this treatment and burn or bury deeply. This is a good old remedy, but if you do not believe in drugging chickens, mix a teaspoonful of sulphur to each bird in a mash with milk, and I think the worms will "vamoose." You know sulphur is considered almost a standard home remedy in some families, and a little mixed in the feed occasionally in dry weather is good for the general health of fowls anyway.

# "Without a Peer"

says one of our customers, writing regarding his WESTERN engine. Extract from his letter is given below:

"It pleases me greatly to be able to say that the engine recently purchased of you has more than met our highest expectations. Of its kind, it is my belief that it is **Without a Peer** in all the West.

In the purchase of the engine I carefully looked over the market, had seen every high powered combustion in the State, had given every argument due weight, had fully considered costs of other powers—both as to first cost and cost of operation—and now after a good test stand ready to say that I do not think we have made a mistake in securing your engine."

The engine referred to is of the size and type shown in cut, and is used for pumping water near San Francisco, Cal.

## Arizona Orange Groves Produce Early Fruit

Orange Grove in Salt River Valley Irrigated by the Basin System.

NOTWITHSTANDING such trying climatic conditions, orange trees have been grown for nearly twenty years at Phoenix and Yuma, Arizona, and for a much longer period at Hermosillo, Sonora. As the country becomes more thickly populated and new railroads open up additional acreage, citrus growing is being gradually extended to many other localities. All through the mountains of southern Arizona there are comparatively frostless coves and foothills which may be made to produce an abundance of high quality oranges and pomelos for home consumption. In each case, however, the very important problems of water supply and transportation will have to be solved before these pioneer plantings may be enlarged into commercial groves. Examples of a few such places are Agua Caliente, seventeen miles east of Tucson; Agua Caliente, northwest of Gila Bend, and areas near Parker and Fort Mojave. Extending for considerable distances south of Parker, on both sides of the Colorado River, there are bench lands suitable for citrus culture. In general, the limits of such citrus areas may be determined by the following factors: Elevations not exceeding 2,500 feet; winter temperatures not below twenty and rarely below twenty-four degrees F., and a reliable supply of irrigation water.

The incentive to grow oranges in the arid Southwest, where climatic conditions are trying to the growth of the trees, is the high price received for the fruit. Fruit from this region is in considerable demand in the Northern markets, chiefly on account of its remarkable earliness. The oranges are also sweeter and are much deeper colored than those grown in humid and less sunny regions.

# Auctions Extraordinary!
## 170 Head Dairy Cows, Heifers, Bulls and Horses

IMPORTED FRENCH COACH STALLION. CONDE 4113.
Will be sold to the highest bidder.
MONDAY OCT. 18TH At 10 O'clock A. M
At my home, one-fourth mile East of Pacific Electric Depot, at
COMPTON.

He is undoubtediy one of the best all purpose stallions in the State. heavy enough for any use, can step in three minutes. Was purchased for $3,500 and will produce the best money making horses in the country.

DESCRIPTION: Dark bay; star, snip, both hind feet white, 16¼ hands high, weighs 1500 lbs. Foaled May 12, 1902. Bred by M. Jacques Navet, Department of La Manche; sired by the Government Stallion Norodum.

Dam, Sympathie by Jolibois; 2nd dam, Negress by Colporture, with continued pedigree back to the year 1734—all bays or browns. While CONDE is undoubtediy one of the finest bred French Coach Stallions in the State, he is also a fine individual and gets fine colts. He has perfect color, size, shape, action and speed. He can be seen any time at above place, where he will be sold at auction.

TERMS: Part cash, balance one and two years with note and approved security and 7 per cent. interest. 3 per cent discount for all cash.

On account of ill health owner is obliged to sell this fine stallion, and he will positiveiy go to the highest bidder. No Limit or Reserve.

# Can the Smyrna Fig be Pollenized Naturally?

## The Blastophaga is Usually Distributed by Hand. Will it be Profitable to Let it Distribute Itself by Grafting Part of Smyrna to Caprifig? Answered by G. C Roeding and G. P. Rixford

THE CULTIVATOR recently received inquiry as to success in fertilizing Smyrna figs with the little fig wasp, blastophaga grossorum. The Cultivator took steps to gather together as much information as possible as to work done by the wasp, and as to whether it is more beneficial to have the caprifig grafted into a branch of the Smyrna tree so that the insect could pass from the caprifig into the edible fig and so do away with the labor of transferring by hand.

We first wrote to Mr. G. P. Rixford, who many

Cross Section of Caprifig Showing Fig Wasp.

years ago was connected with the San Francisco Bulletin, and was instrumental in introducing the first cuttings of the true Smyrna fig of commerce. Mr. Rixford is now connected with the Bureau of Plant Industry of the Department of Agriculture and has had to do with the large Maslin orchards near Sacramento, from which many cuttings have been distributed to all parts of the state, as also have many of the fig wasps. Regarding the advisability of grafting, Mr. Rixford writes:

**Some Phases of the Smyrna Fig Industry.**

The time for grafting fig trees is the same as for other fruit trees, namely in spring when the sap in the tree to be operated upon is active and the buds are pushing. The scions, however, should be dormant and should have been taken in winter. The fig tree is not difficult to graft.

The practice is universal in the Smyrna fig district of Asia Minor to gather the caprifigs at the proper time and hang them in the branches of the Smyrna trees, and this practice is followed in California. The reason for this method is the belief that over pollination causes the Smyrna figs to split in ripening. To prevent this the capri trees are planted by themselves and the figs are hung in the Smyrna trees in numbers proportionate to the size of the tree. This practice does not entirely, if at all, prevent splitting either in California or Asia Minor. The writer has given some attention to this feature of fig production and has observed facts that raise a doubt in his mind as to the accuracy of this idea. In some instances noted it looks as though the conditions of moisture in the soil have more to do with the splitting than over pollination. It is well known that wet ground and late irrigation are prolific causes of this trouble. Instances have been noted where the proximity of the capri trees and consequent excessive pollination had very little to do with it and it appeared to be the fault of the variety. Some trees have been noticed as splitting a large portion of their fruit every year, while in the same orchard another variety of Smyrna, equally exposed to swarms of blasophaga, is entirely free from the defect. This question is being studied by men connected with the Bureau of Plant Industry of the U. S. Department of Agriculture, and it is hoped that before long definite conclusions may be reached.

It is not necessary that more than one or two wasps should enter each Smyrna fig to produce

White Adriatic Grafted with Smyrna Fig Scions.

perfect fertilization, and as small caprifigs contain 200 or 300 wasps and large ones up to 1000, not many are required on each tree. Ten or twelve caprifigs on a five year old tree and twenty-five or thirty on a ten year old tree, are found sufficient at one application.

There is another reason for planting the capri trees away from the Smyrna orchard. We thin apricots, peaches and other fruits to increase the size. The crop of figs on a Smyrna tree can be regulated to a considerable extent by the number of caprifigs applied. Large figs as well as large apricots and peaches are desirable and the size depends much on the number the tree produces. Hence one application of caprifigs will produce a smaller crop than several applications.

All experienced Smyrna fig growers know that the crop is in direct proportion to the number of blastophaga liberated in the tree and three or four applications of caprifigs several days apart produce the largest yield, though not always the largest figs. The reason for this is that when the caprifigs are first applied a certain number of smyrna figs are in a receptive condition. In a few days other figs have grown to a receptive size, but the wasps have all issued from the first caprifigs applied, hence the necessity of other applications.

**From Mr. Roeding.**

Mr. Roeding of Fresno, who is doubtless responsible more than any other for the successful planting of colonies of the blastophaga and whose continued and earnest work in placing the fig industry on a solid basis is worthy of all commendation, writes regarding the distribution:

The expense of distributing the caprifigs is only a small item. Where a person only has one tree, however, of the Smyrna fig and has not sufficient room for another tree, it is entirely practicable to graft a couple of the branches of the Smyrna fig to two varieties of caprifigs. I would recommend No. 1 and No. 3 for this purpose, as they develop all the crops of capri figs so that there would be no question about their retaining the insect throughout the entire season. If the tree is an old one, it would be necessary in addition to cutting the two branches which are to be grafted, to shorten in some other branches immediately surrounding the grafts in order to give them a chance to develop. If this method was not followed, the grafts would be overshadowed to such an extent they would not grow.

In explanation of the process of grafting, Mr. Roeding has sent the engraving given on this page, which show more perhaps than could be given in words. The method so shown has been

Fig Grafting. Preparation of Stock and Scion.

adopted as the best after trying many others. The cleft graft Mr. Roeding says, in a circular touching upon grafting, is objectionable. From this circular we quote below explicit directions.

**To Graft.**

In grafting over orchard trees the branches to be grafted should be cut off to within 18 to 24

(Continued on Page 372.)

# Citrus and Sub-Tropical Fruits

## PHYSICAL CHARACTERISTICS OF THE DIFFERENT TYPES OF LEMONS.

LEMONS are known to be a most variable fruit in their physical characteristics. Not only is this true of trees of any given variety, but in some cases it is also true of the different fruits taken from the individual tree. The manner of handling water and fertilizers is commonly believed to be of great importance in getting smooth, well-shaped lemons. The lemon varies in general from a barrel shape to an almost spherical form marked by more or less pronounced protuberant ends. Thick and conspicuous ends detract from the value of the fruit. The best size of lemon weighs on the average 120 to 135 grams. Of course size is not the only factor which determines the weight, much depending on the rind, quantity of juice, and general solidity of the fruit. The most desirable sizes of lemons average 300 and 360 to the box.

There are usually three grades of lemons, known as "fancy," "choice," and "standard." The grades depend on the general texture of the fruit, the form, and the color. The sizes vary from 180 to 540 to the box, but few lemons are packed larger than the 240 or smaller than the 490 per box size. The better grades are mostly made up of the fruit of fine texture and of good form picked when green and colored either by slow curing in tents or by sweating. The tree-ripe fruit is less commonly used for the finer select grades, since many question its keeping quality. In some packing houses it goes largely into an inferior grade, and at some seasons of the year when the fruit is quite small from 400 to 500 are packed in a box. A very small percentage of fruit constitutes the grade known as "sinkers," or "heavy lemons." This type derives its name from the fact that the fruits sink in water when being washed. They are usually spherical in shape and quite small, with extremely thin rinds and a relatively large amount of juice.

The green fruit after it is properly cured, either by sweating or by the slower tent process, possesses a rich lemon-yellow color which is seldom in the tree-ripe fruit.

There is a wide variation in the texture of lemons, which is currently believed to be influenced by orchard conditions and the season of the year. As a rule, large, overgrown fruit has a rougher texture than smaller fruit. During the curing process the rind is smoothed down considerably and the texture is improved. Tree-ripe lemons usually have a smoother texture than the green fruit.

The rind consists of the external epidermis and a well-developed underlying layer of soft, spongy, white tissue. This layer of tissue contains a considerable quantity of water, much of which evaporates during the curing of the fruit, causing a considerable shrinkage in the thickness of the rind. It is for this reason that the spongy layer of green, freshly picked fruit is, as a rule, thicker than that of the tent-cured lemons. Individual lemons display great variations in the thickness of their rind, a condition which it is difficult to recognize from the general external appearance of the fruit. It appears that good, sound, normal-sized fruit, with smooth or medium texture, as a rule, has a thinner rind than the rough and oversized sorts. The rind of green fruit varies from one-eighth to five-sixteenths of an inch in thickness and averages about one-fourth of an inch. As stated previously, the tent-cured and sweated fruit averages somewhat less, while the "tree-ripes" usually run from one-eighth to three-sixteenths, and "sinkers" vary from about one-sixteenth to one-eighth of an inch, due to the extreme reduction of the spongy layer.

The seed content of the California lemons is very small, indeed. A large majority of the fruit is entirely free from seeds. Now and then one finds a lemon that contains as many as a dozen seeds, sometimes all developed, but more often only partially so. They occur in all grades and varieties of fruit, but it appears that they are found more frequently in lemons of low grade. It is said by some growers that orchard conditions as regards the soil and method of cultivation, as well as the general condition of the trees, have an important bearing on the presence of seeds. It has been noticed that the fruit from some localities displays a greater tendency toward seed production than that from others.

The juice constitutes from 30 to 55 per cent of the total weight of the lemon, varying to a considerable extent with the thickness of the rind and the general solidity of the fruit. In the "tree-ripes," "sinkers," and cured fruit the percentage is higher than in the green, newly picked lemons, for the reason that the latter have more water in their rinds. The juice obtained by expression contains a considerable quantity of mucilaginous material, which gives it a cloudy appearance. Great difficulty is found in removing this material; in fact, all methods of clarifying tested fail to make the juice perfectly clear.

Besides the citric acid, to which the sourness is chiefly due, tartaric and malic acids are present, but in such small quantities that they are probably negligible as to their effect both on the behavior of the fruit itself and on the acid determinations. The specific gravity of lemon juice shows a narrow range of variation. By far the majority of determinations give results approximating 1.035. Numerous samples have given results as low as 1.026 and still more as high as 1.04. It was expected that the specific gravity of the juice would be governed by the acidity, but this was borne out only in a partial way. It was found that either a decidedly high or a decidedly low percentage of acid is indicated by a correspondingly high or low specific gravity. This was especially true when the acid content was higher than usual. Small differences in acidity are not indicated by the specific gravity with any degree of certainty, the variations in the quantity of mucilaginous material perhaps hiding any change which might otherwise be indicated. Experience has shown that a difference of less than 1 per cent of acid can not be foretold by a specific gravity determination of the juice.—From Circular 26 U. S. Dept. Agr.

## PICKLING OLIVES.

From the Cultivator of Sept. 24 of last year we reprint the following information on olive pickling:

"The olives, either green or ripe, should be packed into pails about one-third full of water, to prevent bruising, and sorted as to size and ripeness. The fruit is then placed in suitable vessels (preferably stone jars, though wooden kegs, etc., may be used if sterilized so that they are free from mold spores), the water poured off, and the fruit covered with a solution made of 2 ounces of soda lye, 1 ounce of lime, and 1 ounce of common salt to a gallon of water. The solution should be thoroughly mixed and allowed to stand an hour before using, and is best if made of boiled and cooled water. It should stand about 2 inches above the fruit and if any of the olives float it is necessary to cover them with a board and weight.

The time of the lye treatment varies from three to seven days, according to the variety, size and ripeness of fruit. The solution should be examined daily, and should the sleek, soapy feeling peculiar to lye disappear, it indicates that the solution is exhausted. The old solution should therefore be poured off and new solution added. It should be changed at once should any scum or mold appear. The fruit should be frequently examined, always sampling the largest olives by cutting away a portion with a sharp knife. The progress of the lye toward the interior of the fruit is plainly marked by a distinct dark ring. When the ring has reached almost, but not quite to the pit, it is time to remove the lye and commence the washing.

The lye should now be poured off and water added and renewed morning and night. The wash water should also be boiled as a preventive of mold, which is very likely to develop at this stage of the pickling process. The fruit should be kept in water, as before, with the board and weight, and throughout the extraction, washing and salting, the vessel should be closely covered. It will require from four to seven days to remove all traces of the alkali. Washing should be continued as long as the fruit has the peculiar hot taste due to the presence of lye, and it is well to test it with red litmus paper, which will turn blue if a trace of the lye remains. If the olives are still bitter after the washing has been completed, they should receive a second treatment with lye, followed by washing.

When free from lye, the olives are ready for salting, the brine being composed of 2 ounces of common salt to a gallon of water. It should be thoroughly boiled, cooled and poured over the olives. The next day this solution should be poured off and a solution containing 4 ounces of salt should be used. "If the stronger solution is used to begin with, the olives will shrivel. The fruit should next be treated with an 8-ounce brine, and if intended to keep for some time, finally with a brine containing 14 ounces to the gallon. A 14-ounce brine, however, makes the olives too salty to be used without a slight soaking."

---

The Fourth Carnival of Products held at Santa Ana, Orange county, last week was a complete success. This carnival is proving almost equal to a county fair as a means of bringing together a high grade of fruits and agricultural products.

"Bob—Did you hear about Jim Kline?

"Well, Jim's nephew came out from Chicago this summer to 'rusticate', as he called it, and he asked his Uncle Jim if there were many mosquitoes around here.

"'Well, no,' says Jim real thoughtfully, 'Not if you come at the right time of year.'

"And that roof I used to have on the corn-crib there was pretty much like that—It never leaked if you happened under it at the *right time*.

"But if you didn't want to get your new Sunday suit wet, it wouldn't have paid to hunt for shelter under that roof when it was raining.

"Well, I knew it leaked—but it didn't make much difference in the summer when the crib was empty. I was always too busy in the fall and spring to attend to it, and in the winter when the crib was full was a poor time to put on a new roof. So I was fool enough to let it go a little too long.

"That roof kept getting worse and worse, and first thing I knew I had a lot of spoiled and mildewed corn there on the East half of the crib where the roof was worst. Guess I lost about three hundred bushel that way; rotted so it wasn't even fit to feed the pigs.

"So I come to then—that taught me a lesson. I lost a whole lot more than the cost of a good roof.

"But I've learned by experience—cost me a good deal, too—and by reading the papers—and by keeping an eye on the different kinds of roofing tried around here.

"And you see I've got Rex Flintkote Roofing on that crib now—

"So I know this year's crop of corn will keep sound and dry. I stopped right in the middle of my fall-plowing to put that roof on, too—decided that it was just as important to *keep* a crop as it was to raise it.

"You see I've got Rex Flintkote Roofing on my barn, too—built the barn after I did the crib. Wasn't satisfied with the crib-roof—didn't want shingles—so I made up my mind to make sure of a good roof. It pays, you know—look at all the stuff you've got in a barn—hay and all that—all easily spoiled under a leaky roof. Horses hard to keep in good condition, too, unless they're under a warm and dry roof.

"I looked through the farm papers. Came across a Rex Flintkote Roofing ad.—looked good to me—sent for free sample—tried it with live coals of fire—proved it wouldn't catch—tried it every which way. That looked to me like mighty fair-and-square proof that Rex Flintkote Roofing would stand the racket better than anything else I could get. So I put it on.

"Another thing—you've generally got to hire a carpenter to put on shingles—and an expert to lay tin or tar-and-gravel—

"But anyone can lay Rex Flintkote—any farmer or his hired man. Do it when other work's slack—all you need is a hammer and a little ordinary common sense. Everything else comes in the roll.

"It's made of a long-fibre felt—and thoroughly saturated with some kind of indestructible mineral waterproofing compound. Every little pore is filled up tight with this compound—so neither the hot sun or the rain or snow, or anything at all, can get at it. You know these things soon eat the life out of other roofing materials.

"Yes, you can get Rex Flintkote at most any dealers. Look for the Boy trademark—or write the manufacturers—they'll tell you. And they'll send you free samples to test the way I told you I did—And a mighty good little book about roofing, too. Just write to

### FARMERS' WEEK PROGRAM.

THE program for Farmers' Week at the University Farm at Davis promises a feast for every one in this state who may be able to take advantage of the opportunity to be present the week beginning Monday, October 25th. The program continues until four o'clock Saturday afternoon. Reduced fare has been secured on the railroads and an effort will be made to accomodate all in the town of Davis.

An idea of the feast to be given for the week may be had from the following which is condensed from the program:

The first session opens at ten forty-five Monday morning, with an address by Prof. I. P. Roberts on Conservation of Our Greatest Resource, The Soil. Other features for Monday are: Cattle Flies in California, W. B. Herms; Judging Demonstration of Dairy Cattle, Prof. Major and F. D. Hawk; Forage Crops, Prof. Wickson; Agricultural Education, Leroy Anderson; The Dairy Industry in California, H. A. Hopper.

Tuesday, October 26th: The Farm Separator, H. A. Hopper; The Minus Quantity in California Soils, G. W. Shaw; Forage Crops, E. J. Wickson; Marketing Pure-bred Livestock, E. W. Major; Essentials of Success in Cereal Culture, G. W. Shaw; Annual Meeting University Farm Students Association; Judging of Beef Cattle, E. W. Major.

Wednesday October 27th: The Farmer and Quality in Butter, H. A. Hopper; California Horticulture, W. T. Clarke; Composition of Milk with Relation to Cheese Making, L. M. Davis; Forage Crops, E. J. Wickson; Some Results of Work at the Petaluma Poultry Station, M. E. Jaffa; Draft Horses, Howard Phillips; Control of Grasshoppers, C. W. Woodworth; Administration of Pure Food Laws, M. E. Jaffa; General Conference on Rural Life, Addresses by Mrs. M. E. Sherman, Fresno, Mrs. Geo. W. Pierce, Davis, Leroy Anderson and others.

Thursday, October 28th: The Farmer's Interest in Cream Sampling and Testing, H. A. Hopper; Value of Keeping Pure-bred Dairy Cattle; F. D. Hawk; Diseases of Stone Fruits, their Nature and Control, R. E. Smith; Forage Crops, E. J. Wickson; Fertility of the Land, I. P. Roberts; Some of the Causes of the Present Depression in Grape Growing, F. T. Bioletti; Farmers Institute Conference Address by J. B. Neff, Anaheim; Judging Sheep, E. W. Major and H. Phillips; Addresses by W. R. McIntosh, Fresno, and Mrs. M. E. Sherman, Fresno.

Friday, October 29th: Methods of Disposing of Milk, H. A. Hopper; Bovine Tuberculosis, A. R. Ward; Diseases of Pear and Apple, their Nature and Control, R. E. Smith; Forage Crops, E. J. Wickson; Some Needed Improvements in Grape Growing, F. T. Bioletti; Luther Burbank and His Work, E. J. Wickson; National Livestock Interests, Hon. H. A. Jastro; Marketing Organizations, Hon. J. W. Jeffrey; Judging Horses, E. W. Major and Howard Phillips; Reception.

Saturday, October 30th: Insecticides, C. W. Woodworth; Directors Meeting, Sacramento Valley Development Association; Judging Swine, E. W. Major and F. D. Hawk; Regular Monthly Meeting Sacramento Valley Development Association; Good Roads in California.

### LIPPIA SUBDUES MORNING GLORY

THERE are many receipts going the rounds for the eradication of morning glory, the most satisfactory one being the conversion of the infested lot into a hog pasture. This is satisfactory in the case of vacant land, or high pruned orchards, but impracticable in the case of a vineyard.

We had occasion during last spring and the current summer to make observations on the workings of a new enemy of morning glory. The tract of land lying south of Marysville on the east bank of the Feather river, comprising some 22,000 acres and belonging to the Farm Lands Investment Co,, contains about 3000 acres of rich bottom laud. All of this and several thousand acres of the upland has morning glory scattered over it. During the last few years, Lippia repens has covered a large portion of this vast ranch, thousands of acres now being a Lippia lawn. In an experimental garden of ten acres that we selected because it was comparatively free from morning glory, we found that the morning glory increased after the Lippia sod was turned under. Two cultivations killed all the Lippia, but the morning glory is still with us. Outside of the cultivated portion, there is a thick, heavy sod of Lippia, but no morning glory is visible.

This land was farmed to corn last season and the Lippia was all killed, but morning glory was well established over most of the area. Early in the spring Lippia seed scattered by the winter floods began to show up and at this time has taken possession to the exclusion of the morning glory. Patches where the latter was in bloom are now solid with Lippia with the enemy vanquished.

Just how long it will take to kill it in this way, if it will at all, remains to be seen. In the meantime

the Lippia is making the bee men happy, for it is a great honey producer. I never saw bees as numerous on white sage in Southern California as I have on this Lippia.

It is my opinion that where irrigation is possible that orchards and vineyard can be freed from morning glory by allowing the Lippia to form a sod while irrigation keeps up the required moisture for the trees.—J. W. Mills.

### PEAR THRIPS.

Bulletin No. 80, Part IV of the Bureau of Entomology, touching upon pear thrips and its control, by Dudley Moulton, is an excellent account of investigations of this remarkable pest. Mr. Moulton describes attempts at control by cultivation, plowing and handling of the soil, and also by spraying. The tone of the report is most hopeful and shows that the pest may be subdued in a large measure. The summary in which the more extended information of the bulletin is condensed, is as follows:

**Summary.**

The pear thrips has been found only in localities in the general region of San Francisco Bay. Its presence in other countries is not known.

The adults accomplish their feeding injury by rasping the tissues and sucking out the plant juices in the early buds and blossoms. Larvae feed more especially on the larger leaves and on fruits. Adults cause the scabbing on pears, while larvae produce the scabbing on prunes.

Adults emerge from the ground in late February and early March, just when most trees are spreading their buds and opening into bloom. Eggs are placed mostly in the blossom and fruit stems and in leaf petioles. The larvae hatching therefrom feed for two or three weeks, then drop to the ground, where they form a tiny protecting cell within which they remain during the rest of the year. The pupal changes take place within this cell in the ground during October, November, and December.

To gain complete control of the pear thrips, both plowing and spraying should be adopted as remedial. Land should be plowed as soon as possible after the early rains in October, November, and December, to a depth of from 7 to 10 inches, harrowed or disked, and then cross plowed, the second plowing to be followed also by harrowing. The pupae are by this means broken from their protecting cells and most of them either injured or killed.

A combination spray of black-leaf tobacco extract in the proportion of 1 part of extract to 60 parts of water and 2 per cent distillate oil emulsion or a spray of black-leaf extract alone, should be used against the adults during early March, just when the cluster buds begin to open, and against the larvae in April, after the blossom petals fall. The thrips must be killed by contact insecticides, and not by internal poisons.

Fertilizers and irrigation do not kill the thrips in the ground. They act against them only indirectly, by placing the soil in better condition for cultivation and by strengthening the trees.

### MAYETTES AND CONCORDS.

The Cultivator unintentionally gave a wrong impression in the headlines of its leading article last week, which read, "Promising Strains of Mayettes and Franquettes." The article did not touch upon Franquettes other than to refer to them, and the two varieties which Mr. Coates recommended were the San Jose Mayette and the Concord. Both of these nuts have been tested, as was stated in Mr. Coates' article, in various sections of the north and found exceptionally well adapted, heavy bearers and practically immune to blight. In this they are not "promising" but have proven their worth.

Mr. Coates has introduced many varieties of fruits to California growers, which have proved their value by being stayers in the horticultural field. Some have places in the catalogues of practically every nurseryman of the state.

## Time tells the tale!

Measure the cost of ready roofing by what it will do all the way through.

## Genasco Ready Roofing

costs a little more in the beginning than ordinary roofing because it is made of genuine Trinidad Lake asphalt; but that gives it life to resist sun, air, heat, cold, rain, and fire. You are sure Genasco will last—you know what it's made of; and you know it is cheapest in the end.

Insist on Genasco—the roofing with a thirty-two-million-dollar guarantee. Gives absolute protection to every building on the farm. Mineral and smooth surface. Look for the trade-mark on every roll. Write for Good Roof Guide Book and samples.

## THE WHOLE HERD.

By Mrs. M. E. Sherman.

THE small loss to the general farmer of keeping a poor cow, one that produces less than 3000 pounds of milk a year, is not noticed so quickly as in a dairy herd. The other products from the cow deceive many people as to the profits. The pigs a year like this when "pigs is pigs" add to the confusion of the mind. We have a goodly quantity of skim milk to feed and the other day some pigs dropped in March went to town on the small delivery wagon, and back came a check of $84.00. These pigs had cost little, as they had lived on alfalfa and skim milk until the last four weeks when sugared raisins, worth one cent a pound, had been added to their diet. Every year in the market there are dried fruit, figs and spoiled raisins that are good stock feed to finish off the pigs. Hogs I do not raise, but turn the swine off at six to eight months old. The Berkshires make good fat growth at that age and I find it best not to buy sows at all, but to secure every year a young male to add to the band. This new animal is carefully kept away from all the rest for six months and then I feel sure he is all right to let out for if he had any disease, it would have developed before that time.

### Diversity.

The small farmers flocking into the Fresno region are not looking for orchards or vinyards, but for small unimproved farms of forty acres. These men will have a few cows, a few pigs, and raise general crops, having a few acres of this and that, until the California spirit strikes them. We hope it may not do so, as the country needs farmers that will grow their own food and then the food for their cows and horses, and sell the surplus. The present system of having one crop, selling it and buying everything else is bad. When the crops are light or prices bad, the farmers suffer. During the present depression in raisin prices the banks are the only people that are thriving, though the people of the town of Fresno having in many cases struck oil in the last few years are not feeling the pinch as closely as the vineyardists.

### Whole Law.

First, the cow must be bred for production, then fed constantly so that she has enough to maintain her bodily fat at all times under the strain of milk producing. It will not do to think the cows can skimp along this month, and next month make it up by extra heavy feeding. When the hay is short, run the mower to cut the alfalfa even if it is not very tall. Hay can be bought to take the place of that cut to feed. If the cows are let drop in their milk the cost of carrying them the rest of the year will not be met. It cannot be too strongly stated that the instances are too rare to be considered in which the cows once allowed to drop down in the milk flow regain it before they become fresh again.

### Value of Silage.

The silo on a California farm is a great conserver of the steady milk flow. A silo stands always ready to take any green stuff that cannot be handled in any other way. At present the rain has caught the last crop of alfalfa and the mower is out cutting it for the silo. It will go on top of the sorghum, as the sorghum that was left over, topped out the corn. The cows will have to eat through a variety of feed before they reach the bottom. If we have a warm winter they will not reach the bottom before the first foxtail alfalfa is put in. Some years the silo is never emptied and we have to watch the chances of running out the feed to coat the inside with coal tar.

The silo harmonizes the work, as it is hard to stop the vineyard and orchard work to make up a little amount of hay and the labor of handling the first fifty tons of alfalfa amounts to nothing if turned into silage. The mowers run in the morning, and in the afternoon the same teams haul in to the cutter engine the cut alfalfa. The engine starts after dinner and by night time the morning cutting is in the silo. The men do not strike for extra pay as they do when the hay is made. One or two days puts the cutting into the silo and the teams go back to the plowing and cultivating. Along in mid-summer a spirit of weariness overtakes the cows. Silage then comes in to rally their appetites. They can eat it with little exertion of gathering and the milk is held up to the spring grass flow. The silo is a way of soiling cattle, at least expense and with the food always at its best. Tne fields are not tramped, but allowed to raise a normal crop to be put into the silos green or made into hay as best fits in with the other work in hand.

### Feeding.

A cow may be said to gather her feed like a woman going to market with a big basket. The cow swallows down the grass without chewing, only wadding it into a mass very like a quid of tobacco. These masses are packed away in the cow's first stomach and when the basket is full she lies down to chew her cud and the expressing of her countenance changes. While gathering the food she was sprightly and animated, moving around with energy, then as the cud is taken up an expression of peace and quiet comes over her face. She lies there full of enjoyment of the flavor of the food. The small boy often says apt things, and Leonard one day remarked that he wished when he had eaten his Christmas dinner that he was a cow, for then he could chew it all over again all afternoon.

When the cows have to walk over the field to secure a stomach full before going to ruminate, it may be good training for muscle, but milk is the cow product. There is no more peaceful and beautiful sight than a herd of

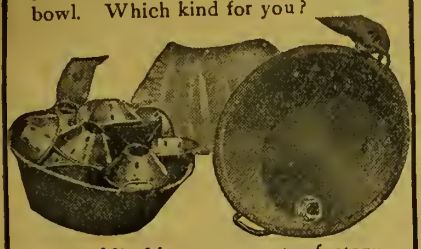
## Save Yourself

Farmers and dairymen who first buy a common, "bucket bowl" cream separator are sure to wish they had bought "The World's Best" instead, and finally discard their common machine for a Tubular. But most farmers are quicker to see the point; they save themselves such experience by getting a Sharples Dairy Tubular Cream Separator in the first place. Why don't you?

The dish-pans show one difference. One pan contains the single piece used in Sharples Dairy Tubular bowls. The other pan contains the stack of disks used inside a common bowl. Which kind for you?



World's biggest separator factory. Branch factories in Canada and Germany. Sales exceed most, if not all, others combined. Write for catalogue No. 260.

well fed cows lying in the shade in a green field chewing their cuds.

### Increasing Yields.

The usual way a dairyman increases the milk yield of his herd is by going out to buy more cows. If the money is put into pure bred cows he is gaining, but if he simply buys other people's misfits the gain is not there.

Weeding out the poor cows and feeding the food to the best ones will bring about an increased milk flow. Since I have been afraid to add cows to the herd on account of the prevalence of aborting and tuberculosis. I have found it less expensive to increase feed than to increase the herd. Also, take off the cows anything that taxes their energies. Make them as comfortable as possible, giving shelter from storms and abundance of succulent feed.—M. E. Sherman.

### SOME FACTS ABOUT MILK.

Some idea of the importance of milk as human food may be gained from the fact that about one-sixth of the total food of the average family is furnished by it and its products.

Of the various mammals whose milk is used for food in different parts of the world may be mentioned the goat in the hilly districts of Europe, the buffalo in India, the llama in South America, the camel in desert countries, and the mare on the steppes of Russia and Central Asia. Sheep's milk is used in some countries for making cheese and in other ways, and the milk of reindeers is commonly used as food in the arctic regions With us the milk of the cow so far surpasses all other kinds in importance that unless otherwise specified the word milk is taken to refer to cow's milk only.

Good, unadulterated milk should contain about 87 per cent. of water and 13 per cent. solids.

Milk contains bacteria of many kinds and in varying numbers. They cause the souring of milk as well as the ripening of cream and cheese, and produce many other changes in the appearance and flavor. The number present in freshly drawn milk varies enormously with the conditions of milking, and, as they are greatly increased with dirty and careless handling, cleanliness in all matters pertaining to the milking and marketing of milk and keeping it in the home can not be too strongly insisted on. Disease germs, notably those of typhoid, diphtheria, scarlet fever, and tuberculosis, may also be carried in milk; so that the purity of the milk supply is of vital importance to every family and community.

The problem of keeping milk sweet is one of checking the growth of the bacteria; and as they are inactive at a temperature below 50° F., milk should be kept in a cool place. Two common methods for preserving milk are pasteurization and sterilization. In the former the aim is to apply heat in such a way as to kill most of the bacteria without producing undesirable changes in the milk; in the latter, to apply enough heat to kill all the bacteria, but with the least possible undesirable change. Chemical preservatives in milk are considered injurious to health, and are forbidden by pure-food legislation in many States.

What is commonly known as the richness of milk depends upon the amount of butter fat it contains. There is so much difference in the composition of milk from different cows that large butter and cheese factories now test all the milk they buy, and pay for it according to its butter fat content.

Mother's milk is best adapted by nature to the nourishment of infants. Cow's milk is the most common substitute, and when necessary is artificially modified to make it resemble human milk.

The value of milk for adults is in combination with other foods; not as a beverage merely, but to supply in part the material needed for the body.

Unless exceptionally high prices are paid for it, milk is fully as economical a source of nutrients as other animal foods, but dearer than most staple vegetable products. Milk, however, requires no preparation, has no waste, and is more thoroughly digested than most vegetable foods. As a source of protein, the most expensive of the nutritive ingredients, it is especially economical. Skim milk, which is whole milk minus part of its fat, and which costs only half as much as whole milk, furnishes protein about four times as cheaply as beef. Foods prepared with either skim or whole milk are much more nutritious than those prepared with water.

## Wood Soled Boots and Shoes

### Creamerymen, Milkers and Farmers

Write us for prices and descriptive circular of our line of wood soled boots and shoes. We carry the very best goods made in this line. The uppers are made of the best quality of Milwaukee oil grain leather. The soles are well shaped, comfortable, and fit as well as all leather boots or shoes.

We all know wood is a non-conductor, consequently it is much drier and a great deal warmer in winter. They are lighter than Rubber or Leather Shoes and Boots. Shoes, $2.00; Boots, $3.25. The wood sole boots are an absolute safeguard against rheumatism as they keep the feet dry both summer and winter.

## YOU CAN'T CUT OUT

A BOG SPAVIN, PUFF or THOROUGHPIN, but

## ABSORBINE

will clean them off and you work the horse same time. Removes Bursal Enlargements, Thickened Tissues, Swollen Glands, Shoe Boils, Capped Hocks and any Puff and Swelling. Cures any Strain or Lameness; allays Pain; Restores the Circulation. Removes Rheumatic Deposits, Enlarged Veins, Painful Swellings and Afflictions. Healing, Pleasant and Safe to Use.

Look over your stock—fix them up now when you have time and be ready for the sales or races later with sound, smooth horses.

You can buy ABSORBINE at regular dealers. Price $2 per bottle, or sent to you express prepaid with full instructions. Write me about any special case on which you would like advice.

### A Good Liniment

**For 80 Cents a Gallon Can Be Made as Follows:**

| | |
|---|---|
| ABSORBINE . . | 4 ounces |
| VINEGAR . . . | 1 quart |
| WATER . . . . | 3 quarts |
| SALT PETER . . | 1 ounce |

Use it for bruises, strains, collar galls, to toughen the shoulders on work horses, to reduce swellings and for all kinds of troubles where a liniment is useful.

Edward S. Holder, Wabash, Ind., the famous Trick Rider and High School Saddle Horse Trainer, writes W. F. Young, this city, as follows:

"I have often intended to write you of the wonderful cure I effected with your ABSORBINE JR. I had a ligament badly strained and was unable to mount a horse. I used the ABSORBINE JR., and have, practically speaking, never had a pain from it since and can mount a horse as good as ever. I give all the credit of the cure to ABSORBINE JR., and have recommended it to many."

**$1 a bottle at dealers or postpaid.**

## GOOD POISON FOR SQUIRRELS.

P. D. BARNHART, editor of Pacific Garden, called us over the phone the other day and said that of all poisons he had used to dispose of ground squirrels, the watermelon rind—strychnine combination beat the whole bunch. At times of the year when green feed is scarce, especially if the squirrel holes are a long distance from a melon patch, pieces of the rind with a small quantity of strychnine stuck into each here and there, will kill them off rapidly. Mr. Barnhart was attempting to grow eucalyptus on lands in the Toluca section, and found it a hard proposition because the squirrels took a large proportion of the trees, but by the use of this bait he killed them off, literally by hundreds. To secure the best results, the pieces of rind should not be too large and should be scattered near the holes and left for Mr. Squirrel. Another satisfactory result was that the coyotes which swooped down on the dead squirrels were brought to their finish by the strychnine. This is a very effective double shot remedy, and those who have not succeeded with the poisoned wheat may do well to try it.

## ONION THRIPS.

The prevailing pest upon onions in this country is the thrips. This is a minute, dark colored insect, which deposits its eggs on the young and tender sprouts of the onion, especially before the formation of the bulbs. The larva is a small green worm which feeds by sucking the juices of the plants, giving them a mottled, pale and wilted appearance. The remedy for this pest is whale-oil soap emulsion, made as follows: One pound of the soap is sliced into one gallon of hot water, which is thoroughly stirred, when enough water is added to make four gallons. The mixture is again well stirred and applied while warm with a spraying machine. Six gallons of water to one pound of soap is also effective, while some recommend one pound of soap to two gallons of water. This spray should be applied several times to insure eradication of the pest, as the eggs are unaffected by the spray and hatch at intervals of a week or ten days. Onion sets bought in the market are frequently a source of this pest.—Denver Field and Farm.

## MULCH IN THE GARDEN.

One of the greatest aids to successful gardening is the old-fashioned practice of mulching; those who have adopted it, particularly in hot, dry weather, are convinced of the fact that by its means the fertility of the soil and the quality of the crops are greatly improved. Broadly speaking mulching serves a two-fold purpose; (1) it helps to conserve the moisture in the soil and (2) it provides additional nourishment for the crop.

The best time to apply a mulch is after the rains have given place to the hot, dry weather. In this way the covering prevents the escape of the heat which is stored up in the soil, and the moisture which is about the roots cannot be lost through surface evaporation.

The best mulch is one which is composed of half-decayed farmyard manure, with which has been retained a fair amount of the straw. Fresh stable manure is another very good mulch. In gardens where there is a large quantity of lawn, the cut grass from the spring mowings, if saved in a heap, will also prove suitable for the purpose.

In cases where the mulch has to be applied near or within view of the house and where the long manure may prove unsightly, it can be passed through a coarse sieve or else it may be covered with sifted soil.

## CABBAGE APHIS.

The cabbage aphis is pretty troublesome this summer and will continue so until late in the fall. The broad leaves close together on the head afford an excellent shelter for these aphids. They occur in large numbers and feed in colonies, being easily recognized by a grayish color caused by an excretion from the insect. Clean culture is very important in the field as well as along the fences. When the cabbage is cut, destroy all the leaves, stumps and other refuse as these furnish a breeding place for the aphids, many of which live through the winter in the egg or adult form. This being a sucking insect, kerosene emulsion is perhaps the most effective spray but cannot be used after the cabbage is heading as the taste of the kerosene would be noticed on the cabbage. Whale-oil soap solution as well as pyrethrum may be applied. The destructive work of the insect may be checked by the use of water forcibly applied through a spray pump.

## BLACKBERRY RUST.

Rust is the greatest foe of the blackberry and our scientists seem to have surrendered to it without much of a battle. Judging from the nature of the rust fungus, however, there seems to be no reason why the spraying that is efficacious for other fungi should not be so here. The rust spore must alight on the leaf and germinate there in order to obtain an entrance and foothold. If that leaf be coated with copper, the spore will not germinate. Once infected, a plant is lost, but I can see no good reason why preventive measures should not be effective here. Try Bordeaux, then, for the rust, using a 2-2-50 formula. Spray all during the rust season, from the time the young canes are a foot high till the red rust spores have disappeared and meanwhile grub out every infected bush you can find in your neighborhood.—Oregonian.

The garden is a profitable piece of land. It pays to inclose it with a tight and substantial fence so that the chickens will not bother. The women folks will appreciate this. Since the garden is really a part of the home grounds, it will pay to make the garden fence beautiful as well as useful.

### MEALY BUG AND SCALE.

SOMETIMES we get plants on which this pest has established itself, and in this way other plants in the collection become infested.

Another name for the mealy bug is cotton aphis, and this is much the more appropriate name, for the creature resembles a bit of cotton more than anything else.

Indeed, if one has never seen this enemy of plant life he would not be likely to suspect that the bunch of down showing here and there on the plant—mostly in the axil of the leaf, or some other place in which he can stow himself away snugly—harbored a living organism.

But stir the cottony mass up a little and you will discover life in it—life enough to do a great deal of injury to your plants by sucking the sap from them. If let alone the plant soon becomes covered with cottony tufts, under which the enemy lurks to do his deadly work.

Fight the mealy bug pest with an emulsion prepared as follows:

A good white soap, melted, one pound; kerosene, one teacupful.

While the soap is hot pour in the kerosene. A union will take place. Use this emulsion one part to 10 parts water.

Spray the plants affected very thoroughly, taking great pains to get the mixture into every nook and crevice where the mealy bug has seen fit to establish himself. This emulsion can be kept indefinitely in closely corked bottles.

This same emulsion is of great value in the treatment of scale, which is often found on palms, oleanders and other thick-leaved plants. Use one part of the soap-and-kerosene mixture to six parts water, and wash the plants leaf by leaf with it, rubbing them well with a soft cloth to dislodge the scale after the application has been made.—Farmers and Drovers' Journal.

The above may be all right for the house plant grower in a section where there are no citrus or other valuable trees which may be affected. In such a case thorough fumigation with a strong dose of hydrocyanic acid gas only will suffice.

### STAKING GLADIOLUS.

I plant my gladiolus in beds about six feet across, and of any desired length. Shortly before the time for the plants to throw up flower-stalks I procure coarse-meshed wire netting the width of the bed and as long as needed. At the ends and along the sides I drive stakes about three feet apart.

These are a foot and a half above the ground when in place. I run a stick of thin boarding—lath will do—from post to post, all around the bed, and at intervals of about four or five feet strips are placed across it on top of this frame work.

Over this foundation I spread the wire netting, fastening it here and there to the strips by tying. As the flower-stalks reach up they easily find their way through the meshes. The netting furnishes all the support they need, and the result is an entire lack of formality.

The plants are never formal in appearance, because they have practically arranged themselves. The netting is hardly noticeable and the stakes can be made quite unobtrusive by giving them a coat of dull green paint.—E. Rexford in Farm Word.

### GIANT CACTUS.

The Giant Cereus of Arizona and Northern Mexico is the largest growing member of the cactus family, attaining a height of 60 feet and a diameter of two feet or more. In the United States it is usually known simply as the "Giant Cactus." In Mexico they call it the "Saguarro" (the "g" has the sound of "w"). In proportion to their size, the Giant Cactus are among the heaviest plants known, the body being composed largely of water. So full are they that travellers nearly perishing of thirst have saved themselves by cutting out a large piece and shaping the bottom of the wound to catch the water or sap, which collects in a considerable quantity in an incredibly short time. One would scarcely seek to quench his thirst in this manner except in case of dire necessity, for the sap is not of a pleasant taste.

The flowers, usually white, though sometimes tinged with smoky blue, are borne in a circle of clusters near the top of the plant, giving the effect of its being crowned with a wreath of white blossoms. The blossoms are followed by dull red, edible fruit, quite like a fig or pear in shape. The native Indians make it a point to gather all these fruits for food and in addition manufacture from them an intoxicating beverage. To obtain these fruits, the Indians push them off one at a time, using a long pole, which is sometimes obtained from a dead trunk of one of these giants, for when dry the body splits up into thin strips the extreme length of the plant. The flower of the giant cactus has been adopted by Arizona as the territorial flower, but the sensational newspaper articles about the danger of its extinction are greatly overdrawn.

Beds of Geranium are exceedingly ornamental, provided they are kept in tidy condition. This can only be done by keeping all flower-trusses picked off. If the faded flowers are allowed to remain I know of no plant that can take on a more unsightly, slovenly look. Of course all the buds in a truss do not develop at the same time, and one does not like to destroy undeveloped flowers, but the clusters can be made to look clean and attractive by pulling away from them all flowers that have passed their prime and taken on that draggled look which so detracts from the sightly appearance of everything else in the bed. Unless one has a great number of plants this can be done in a short time. It will be found much easier than going over the bed and cutting out all the faded flowers as sometimes advised.

Too much stress cannot be laid upon neatness in the garden. If faded flowers and fallen leaves are allowed to accumulate, the charm that should characterize it is gone, and no amount of bloom can make up for the lack of care which is thus made manifest.

**Burr Clover** The best cover crop. We can offer it at a reasonable figure. Write to us for prices on this and other green manuring crops.

Get Our Prices on New Crop ALFALFA SEED.

## Horticultural Examinations.

THE first examination by the state board appointed to investigate as to qualifications of applicants for position of country horticultural commissioner, was held in the city of Los Angeles last week. From those who qualify the board of supervisors will select the county commissioner.

San Bernardino and Riverside counties next held examinations and we understand other counties will hold them in turn until all have been visited by the examining board which is composed of A. T. Garey of Los Angeles, E. K. Carnes of Sacramento, and E. B. Collier of Corona.

## Five Acres Apiece.

CONSIDERABLE interest is being stirred up in Southern California, and in fact through the whole country, over the proposed action of the Department of the Interior in assigning only five acres to each member of the Yuma Indian tribe in lieu of the reservation which is to be taken from them and thrown open to public entry in the near future. In many former cases each Indian has been granted a quarter section. In the present instance water has been brought under control and will be conducted to these lands so that each five acres apportioned will have its individual water right. But those who would see justice done to the Indians argue that while a white person might make a living from five acres, it would be practically impossible for an Indian to do so, and are appealing to have the amount doubled so as to give ten acres to each. It seems that such action would be eminently just to the Indians, and we do not believe it would be unfair to anybody else. Resolutions have been passed by representative bodies urging this, and many petitions have been forwarded to the Department.

## Department of Health.

WE HAVE received a bulletin from the Committee of One Hundred on National Health with headuarters at New Haven, Conn., which presents various arguments for the creation of a cabinet department of national health. This is said to be promoted by the insurance companies of the country, or at least with their co-operation. It is possible such a movement may find favor in the eyes of the people, but to us it looks as if specializing on every feature appealing to certain classes as worthy of more attention, is being carried to extremes. The Department of Agriculture has aided in such matters in the past and doubtless will continue to do so. This is a question of education of the people and we hardly feel that it requires a special cabinet position.

## Yuma Indian Reservation.

MANY inquiries have come to the Cultivator regarding time of opening of the Yuma Indian Reservation. In the course of correspondence with the Department at Washington on the subject, we have received the following under date of October 7th from Mr. C. J. Blanchard, Statistician.

"I regret very much that it is not possible to give you definite information as to when the lands under the Yuma Indian Reservation will be opened to entry. This information can come only from the Secretary of the Interior. It is the custom for the Department to issue a public notice about sixty days in advance of the formal opening. This notice will give full details concerning the method of disposing of the lands, terms of water right conditions, etc."

## Fuel.

THE Santa Ana Bulletin suggests that if the pumping plant owners in Orange county were wise they would form a co-operative organization to send a representative to Washington to make a thorough study of the manufacture of denatured alcohol, preparatory to establishing a co-operative still to produce fuel for the pumping plants of that section. It is very probable that such a scheme might work out, as there is almost unlimited vegetable refuse which might be used for the manufacture of alcohol. The suggestion at any rate is worthy of investigation.

## State Grange.

THE State Grange held its regular annual session in Petaluma last week with a full attendance of delegates from various northern counties. This organization has granges in nearly every section of the north, but the southern part of the state has never been thoroughly organized. Reports were received from state officers, a reception was tendered by the Sonoma County Grange, and a most profitable session held.

## Farmers' Week.

ON THE deciduous page of this issue appears an outline of the program for Farmers' Week, October 25th to 30th, at the state farm at Davis. This will be a most profitable week, and every farmer who can break away to attend should do so. The program is remarkably good and should prove most helpful.

## Dry Farming Congress.

FINAL announcements are being sent out of the Dry Farming Congress to be held in Billings, Montana, October 26, 27, and 28. Speakers from various parts of the world are scheduled and an excellent program is promised.

## Pollenizing the Smyrna Fig.

(Continued from Page 363.)

inches from the point of divergence from the body of the tree, allowing at least two branches to remain, one of which should be on the southwest if possible, so that the grafts will be shaded from the afternoon sun.

The object in leaving the branches is for the purpose of having an outlet for the sap, for the removal of the entire top of the tree is dangerous. In the coast counties fig trees, and other trees as well, can have their entire tops removed, and still withstand the shock, the scions taking readily, if properly inserted, but in the interior valleys, where the atmosphere is dry and warm, to remove the entire top of a fig tree close to the main body would result in the loss of the tree, a fact which has been fully demonstrated by the writer by actual experience. The two branches which have been allowed to remain can be sawed off entirely the following season, or they can be in turn grafted, if the scions of the year before have not taken well, or if you have not sufficient branches from your preceding season's grafting to form a good head on the tree.

After having sawed off the branches the stumps or subjects to be worked on should have the tops neatly smoothed over with a sharp knife so as to have a clean, smooth surface, particularly along the edge. From two to four scions should be placed in each stock, the number of course being regulated by the size of the stump. Cut out a V-shaped piece of bark; the distance from the top of the stock to the point of the V should be from 1 to 1¼ inch.

Select a scion of the proper size, making a sloping cut along the lower end, as long or somewhat longer than the incision on the stock. The scions should be cut the same as for a whip graft, except that the cut is all on one side and should have a little more bevel and the second cut for the tongue of the whip graft should be omitted. The scions should never be smaller than an ordinary lead pencil; as a rule scions from two-year-old wood, as they have very little pith, with a diameter of 5-16 to ½ inch will be found to give the best results.

The scion should be of such a size that it fits snugly into the opening in the stock, so that the bark on both sides of the scion touches the bark of the stock. After the scions are placed, wrap tightly with five or six-ply cotton twine, so as to hold them in place, and cover the wounds as well as the stub with liquid grafting wax. Also be careful to wax the top of the scion to prevent drying out. Never use wax cloth for wrapping, or if you do, be careful to remove it early in the summer before the warm weather sets in, or the bark, when the grafts are set, will be smothered and the grafts will die. After the scions have become well united, which takes from two to three months, the strings can be cut.

The writer prefers this method of grafting to all others and has had no difficulty in making fully 90 per cent of the scions grow, many of them making a growth of 5 to 7 feet in a single season. This method of grafting cannot be practiced until the sap begins to flow, and from the latter part of February to the 1st of April has been found to be the best time. The scions should never be more than 4 inches long.

The grafting wax should be melted in a pot and put on hot, using a small paint brush, or a brush made out of short pieces of hay rope tied to a small stick answers the purpose just as well. The best results have been secured by using a wax made of one pound beeswax, three pounds resin and three ounces of raw linseed oil by weight. Place the beeswax and resin in a kettle and cook same until thoroughly dissolved, then add the oil and allow the ingredients to cook slowly for ten or fifteen minutes longer. Remove from the fire and as soon as the wax has cooled some pour a small quantity into a bucket of lukewarm water. Grease the hands and take the congealed mass and knead and pull it until it becomes very tough; wrap in oiled paper and it is ready for use. By preparing the wax beforehand the ingredients are mixed in proper proportions, which is not easy to do when you have a large amount of work to do in the field. This wax is also far superior to wax which has not been pulled.

# Agricultural News Notes of the Pacific Coast

## Northern California

Hops are selling at more than four times last year's prices.

Biggs, Butte county, is harvesting a large crop of Tokay grapes.

Meridian, Sutter Co., will have an immense crop of beans this year.

California's hop output this year will be only about half the normal.

Secretary Ballinger recently inspected the Orland Irrigation project.

State Grange Patrons of Husbandry held its annual session in Petaluma last week.

Immense numbers of Tehama county sheep have been sold during the last week.

Butte County reports ideal citrus weather with oranges promising an earlier season than usual.

The foundation for the big dam at East Park at the head of the Orland project has been completed.

A colonization scheme is on foot by which 5000 acres of Brown's Valley, Yuba county, may be utilized.

A Santa Rosa poultryman has invented and is manufacturing an incubator which he calls the Santa Rosa.

Biggs reports practically all harvesting of fruits as finished. Figs are the only crop yet being gathered.

The warm weather following the recent rains has proven the salvation of many table grapes of Sutter county.

Patrons of Husbandry of California are going to make a pull to secure the next meeting of the National Grange.

Sheep buyers in Tehama county find the supply of sheep much shorter than usual. Owners have refused $4.50 per head.

The directors of the Butte County Citrus Association are preparing for the season's pack and a magnificent yield is promised.

Farmers along Butte Creek near Durham, Butte county, are asking the board of supervisors to aid in the construction of levees.

Ukiah prune growers are marketing their prunes on the two cent basis. They are running so large that they average about $55 per ton.

A number of San Francisco capitalists have organized a corporation for the purpose of growing eucalyptus forests in Tehama county.

Prune growers near Red Bluff, Tehama county, appreciate the warm weather following the recent rains. But few prunes will be lost.

The supervisors of Yuba county have voted $5000 of county funds for protection by a levee system along the north side of the Yuba river.

The chamber of commerce of Sacramento proposes to inaugurate a magnificent exhibit of the products of Sacramento county in the big depot building of that city.

A grazing inspector in the forest service has reported that the injury from forest fires this year in the mountains back of the Sacramento Valley has been less serious than heretofore.

## Central California

Fresno County Fair expects a large exhibit of pure bred farm stock.

Some raisin growers have secured a cent a pound advance on their crop.

Hanford, Kings county, reports practically no damage from the rainfall.

The site for a new co-operative creamery building has been secured at Delano.

Fowler packing houses are working their help overtime handling large quantities of raisins.

Most of the grain of the Valley was delivered and stored in warehouses before the recent rains.

The California Cream and Butter Co. is building a new creamery at Riverside, Fresno county.

Modesto grape growers have declared war on the English sparrow which is doing great damage in the vineyards.

The Fresno County Horticultural Commission reported that red spider has been found in some Tulare county orchards.

The new creamery at Delano, Kern county, soon to be built, will be managed by F. H. Elliot, formerly of the Tipton Creamery.

The September and early October rains have done serious damage to table grapes and will very greatly reduce later shipments.

Beet growers are planning to ask from the State University an investigation of beet blight which is seriously affecting some sections.

The twelfth semi-annual meeting of the Counties Committee of the California Promotion Committee will be held at Visalia November 13th.

Many lemon groves of eastern Tulare county have been either cut out or re-budded to oranges, because of the unsatisfactory condition of the lemon market.

The farmers union packing house at Selma is practically finished except that machinery is delayed in arrival. The house already contains a large amount of fruit ready for shipping.

The horticultural commission of Tulare county has found that lemons shipped into the citrus section have been infested with red scale, and are taking active steps to prevent further shipments.

Grain crops in the vicinity of Tehachapi proved exceptionally good this year and those who have engaged in apple and pear culture are finding them very profitable crops for that section.

A new planting of eucalyptus is contemplated in Kern county. The land company has sold several sections to the California Home Extension Association which will colonize and plant much of it at once.

A farmer at Turlock, Stanislaus county, will make the experiment this season of shipping a car of mixed dried fruits and some honey to a point in the Mississippi Valley. They will be disposed of to the retailers in the smaller towns.

## Southern California

Oranges at Mecca, Riverside county, are beginning to color.

Imperial Valley will soon have an alfalfa meal milling company.

Imperial Valley cotton pickers now report a bale and a third of cotton to the acre in some land which has been picked.

It is reported that the State University will establish an experimental station, in the Imperial Valley, possibly at Heber.

Orange county fruit growers are making a most vigorous kick against the appointment of a political horticultural commissioner.

The citrus growers of Ventura county recently met at Ventura and adopted by-laws and a constitution for a new association.

The Hemet and San Jacinto potato fields produced over four million pounds of Irish potatoes and five hundred thousand pounds of sweet potatoes.

Dairying has been given an impetus in the Coachella Valley, and a number of cows will soon be introduced to increase some of the dairies already established.

Four counties of Southern California, namely, Ventura, Santa Barbara, Los Angeles and Orange, produce practically all the lima beans consumed in the United States.

The Tri-Counties Reforestation Committee at its recent meeting at Riverside passed resolutions completely endorsing the position of Gifford Pinchot in the forest service.

Lima bean growers of Ventura county are strengthening their position every week, and every producer in the state is wishing them well in their efforts to secure a living price.

The Carroll patent dumping appliance invented by Mr. Tim Carroll of Anaheim, patent on which was contested, has proved that it is entitled to the patent, and Mr. Carroll has won his case in the courts.

The California Vegetable Union estimates the coming Orange county celery crop at practically 2000 carloads. Last year's output was about 1700. Extensive shipments will not begin until late in October.

The railroads have finally filed their notice of advance in freight tariff on lemons to take effect November 15th. A strenuous fight against this injustice will be made before the Interstate Commerce Commission.

The efforts of the irrigators taking water from the Santa Ana river, to spread the storm waters over waste lands where they would enter the gravel and later percolate back into the stream course, is being opposed by the supervisors of San Bernardino county.

Arrangements are being made for the equipping of another and much larger creamery at Brawley than has before been established in the Imperial Valley. This concern is controlled by the Imperial Valley Milk Company, of which W. P. Mansfield is President and Philo Jones, Secretary.

## The Coast

Spokane is after the Dry Farming Congress of 1910.

Hawaii produced this year about 1000 tons of honey.

Portland potato prices are now about 60 to 65 cents per sack.

Cloverland, Washington, will market 20,000 boxes of apples this year.

Spokane, Washington, is planning for an extension of her good roads system.

Oregon farmers are disposed to hold their wheat rather than sell at present quotations.

Refuse molasses of the Hawaiian sugar mills is used in the manufacture of alcohol.

One ranch at Odessa, Washington, claims a record of 100 bushels of oats to the acre this year.

A hundred cars of potatoes and apples were shipped from Outlook, Washington this season.

A Wenatchee, Washington, apple grower netted $6,000 from six acres of apple orchard this year.

The gold medal for finest honey at the A-Y-P Exposition was won by an apiarist at Wapato, Wash.

The new Union Stock yards at Portland, Oregon, reports an extremely strong demand for all good stock.

Farmers at Ellenburg, Washington, are planning for a stronger co-operative organization which will handle their wheat.

The agricultural college at Pullman, Washington, will make experiments as to productiveness of sage brush land.

Farmers at Dayton, Washington, are holding their wheat, having stored over 275,000 bushels, rather than sell at existing prices.

The Pacific National Livestock Show held in Portland at the end of September brought out an attendance of over 10,000 people.

Grain shippers of Central Washington have been seriously injured by the car shortage which has prevented proper movement of the grain.

Forty-five square miles of territory will come under irrigation at Husum, Washington, as the result of the recent completion of a long irrigating canal.

The Klamath Falls, Oregon, Water Users Association is preparing to entertain the Senate Irrigation Investigation Committee on its visit there early in November.

For two years experiments have been carried on with Chinese sedge and a Japanese matting grass in the Hawaiian Islands. The results have been very satisfactory.

The co-operative marketing organization of farmers at Pullman, Washington, which is made up largely of farmers union and grange members, will hold regular educational sessions during the coming winter.

State college professors of Washington Agricultural College at Pullman, are maintaining a wheat breeding farm with the especial aim of producing a wheat suitable for the dryer parts of the Northwest.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

## FOR MOULTING HENS

***Feed***

# MIDLAND

## Poultry Food No. 4

***$1.95 per Sack***

Midland moulting food is a balanced ration for the moulting hen and is absolutely the best food to feed for eggs and feathers. By feeding No. 4 now you bring your flock through the moult in good condition, which insures eggs when the market is high.

***Petaluma Incubators and Brooders***

Are still here, after others are gone. ***The Standard of the World Machine.*** Winners of ***more prizes*** awarded by ***World's Fair Judges*** than any other make.

Remember, we make a hot water machine. One of the ***best hot water machines*** on the market.

Send for our Illustrated Catalogue.

Eggs for hatching September 1st '09. Write for circular.

BOX 60, ROUTE NO. 1 SAN FERNANDO CAL

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### RHODE ISLAND REDS.

AMONG many bright men and women who have put forth best efforts toward improving various breed of chickens, surely the name of the Rhode Island farmer who first culled out from his flock all save "red" birds, should stand pre-eminent and like Abou Ben Adhem's "lead all the rest."

I bought a few settings of Rhode Island Red eggs from two prominent Eastern breeders in March 1904 and set them under some Leghorn hens I had ranging around my place.

The eggs hatched well despite their long ride from New England to Kentucky and when the chickens were grown I was so pleased with them I decided to dispose of the Leghorns, confine myself to Rhode Island Reds in the future and to equip my place as an up-to-date poultry plant.

While the Rhode Island Reds, which are a combination of the Cochin, Leghorn and Malay Game are a comparatively new chicken, having only been admitted to the "Standard" by the American Poultry Association in February 1904, I think they have more good practical points combined with fewer undesirable qualities than any other chicken. They are: Broilers at seven weeks, Fryers at nine weeks, Layers at twenty weeks.

When full grown Rhode Island Red hens average 7 to 9 pounds each and cocks nine to thirteen pounds. They are big red birds with red eyes, brown beaks and smooth yellow legs. The males are a rich cherry red and the females a lighter shade of red. They have the laying qualities of the Leghorn, the vitality of the Malay Game and the heavy coat of feathers peculiar to the Cochin—but with bare legs. Their color does not show soil. They are a desirable table fowl at any age, having oblong bodies, wide, deep, full, plump breasts and yellow skin.

They mature early, are very hardy, and will stand severe winters and continue laying. They are good hustlers and bug hunters and require less feed than common chickens. They lay big brown eggs, are enthusiastic setters and excellent mothers. They are free from disease and with their wonderful laying qualities, especially in the winter are the ideal farmers' fowl.

I divided my eight acre orchard into six pens, fenced with 5-foot poultry neting. In five of these pens I keep my laying stock, while the sixth is reserved for hens with little chicks. This latter pen I have equipped with twenty-four lath coops thirty inches square, with removable floors and roofs, each just large enough for a hen and her progeny. These coops my assisstant cleans thoroughly every day and the little chicks wax fat and hearty on a diet of wheat and cornbread until they are six weeks old when I transfer them to the pens with the grown chickens and feed them a dry mash in the morning and a mixed grain ration in the afternoon. I watch my hens and turn the loafers over to John, my assistant, who is also Lord High Executioner.

A hen that will not lay 180 eggs per year when fed a liberal, properly balanced ration, comfortably housed and well cared for, generally cannot in my opinion be medicated or "doped" into laying, and looks better to me on the dinner table than encumbering the ground by her presence. Again by carefully weeding and culling out all birds defective as to color, size, shape, eyes, comb, etc., a better flock is gradually attained.

When my birds are grown I examine each one carefully and if it fails to coincide in every particular with the "Standard" I cut it out of the pen and either eat it or send it to market. I keep nothing in my pens that I would be ashamed to exhibit and in consequence, while my flock is not so large as it might otherwise be, it is very "select" and I get lots of eggs, especially in the winter when prices are high. I expect to stick to the Reds hereafter. It is my opinion that a flock of Rhode Island Reds properly cared for, will do more towards lifting the mortgage with which many an American home is ornamented than many days of toil afield.—Moss J. Beall, Horse Cave, Ky.

### COMBINED POULTRY AND PIGEON SHOW.

The Sixth Annual Exhibition of the Alameda County Poultry Association and the Fourth Annual Exhibition of the California Pigeon Club will be held in Oakland at the Piedmont Pavilion November 23rd to 28th. Much interest is being taken in this event on account of the excellent show hall which will give ample room to handle an exhibition of 3000 birds, single decked and with broad aisles.

Mr. Henry Berrar the well known poultry judge will place awards and Mr. W. E. Whitman and Mr. C. B. Jennings of Oakland will judge the fancy and utility pigeons.

Handsome trophy cups, cash prizes and ribbons will be competed for. The following officers have charge of the joint show. Jas. Stansfield, Pres.; W. E. Gibson, Vice-Pres.; Malcolm Lamond, Treas.; Wm. T. Frost, Sec.; W. C. Wheeler, Superintendent.

### POULTRY QUERIES.

**Sun Flower Seeds.**

Replying to Amateur of Morganhin regarding sunflower seeds, I will say that while I never fed any to turkeys, I have had considerable experience with them as feed.

Nothing, with the possible exception of a limited quantity of flaxseed, is so good for the moulting fowl, as sunflower seeds.

Fed to horses they give a shine to the coat most beautiful to behold. A reasonable quantity makes most beneficial feed for cattle and it seems very probable that they would be good hog feed.

However, I should not advise them as the sole article of diet for any stock. We found the seed difficult to harvest satisfactorily as the heads had a tendency to mildew before getting dry enough to shell readily. They are however a feed which every poultry man may grow profitably when

nothing else could be produced. And it is the things which cost time and foresight rather than money which make any branch of poultry keeping profitable.—B. J. O'M.

### Roup Cure.

The Cultivator of September 23rd contained a query signed Subscriber, Petaluma, asking a cure for roup. The answer was, the ax. Although that may be wise, I prefer to use Royal Poultry Food. I have been in the chicken business more or less for the past twenty-five years and have never had a case of roup. I feed this to the chicks and the roup never gets a hold on them. Roup is a disease like diphtheria or horse distemper. Did you never have a cold in your head when your eyes seemed to bulge from your head and your throat was raw and sore? If you have, then you can pity the poor hen.—Subscriber, Gridley.

### SELLING THE AGED EGGS.

In the Paris markets they have a certain way of deciding the age of eggs, which seems practical.

About six ounces of common cooking salt is put in a large glass, which is filled with water. When the salt is in the solution the egg is dropped in the glass.

If the egg is only one day old it immediately sinks to the bottom of the glass.

If three days old it sinks only just below the surface.

From five days upward it floats; the older it is the more it protrudes out of water.—Farm World.

### THE DUST BATH.

Poultry cleanse themselves of insect pests by dusting their feathers and then shaking the pests off with the dust.

Heaps of very dry dust for poultry to wallow in should be placed in the sun. If possible, have some shelter so as to be warm and perfectly dry.

The dust bath is to the hen what the bath tub is to the individual. When a hen is setting she will come off as regularly to dust herself as to feed, for instinct teaches her that it is the best method of ridding herself of lice. Dust is cheap and should be used plentifully these days.—Successful Farming.

---

The number of eggs a hen may lay before she begins to sit depends a good deal upon her condition when laying. The well fed, fat laying hen will not lay many eggs before she begins to sit, usually. Fattening a laying hen is very apt to cause her to become broody; at least the tendency is that way with larger varieties. However, it would not be wise to feed breeders too heavily.

---

An excellent animal feed is commercial beef meal, which should be fed in a dry state Do not overfeed with any of the meats. Always feed too little, rather than too much, and allow a liberal ration of vegetables to go with them.

---

People on large plants often fail through ignorance, waste and mismanagement. People do not realize that the cause of failure in the poultry business is the same as in any other vocation of life.

---

Cull the flocks resolutely as they grow. Stunted and deformed chickens cannot be grown with profit—kill them. The poultryman's rule must ever be the "survival of the fittest."

---

If the geese have confidence in the feeder they will be very friendly with him.

---

Pure breeds are always to be preferred to crosses.

**Coulson's**
**No 3 Condition Powders**
**for Poultry?**

A first-class tonic and conditioner like ***Coulson's No. 3 Condition Powder*** is of great benefit to the chickens, especially when used at this time of year.

***Coulson's No. 3 Condition Powders*** will prevent diseases, by keeping the flock in a thoroughly healthy condition. By the same means it will keep them laying longer into the molt, and their healthy condition will enable them to molt quickly and commence laying at an early date. As it contains no injurious stimulant, it can be used with perfect safety at all times and for this reason is fed in large quantities by numerous poultrymen.

**It Contains No Cheap Filler**

In buying a bucket or sack, therefore, every pound is of value to the chickens, and will give you large returns for the money invested.

For sale by all dealers or at factory.

# General Agriculture

## AGRICULTURE IN ALASKA.

IT IS more than forty years since Alaska became a part of the United States. It has added over $300.000,000 to our public wealth, yet we imagine it to be a land of ice and snow, desolate and barren, and of little value. It is a vast country having an area of almost 600,000 square miles. It has 26,000 miles of sea coast and over 4,000 miles of navigable rivers. It has the most wonderful glaciers in the world, high mountains, gold, silver and copper mines of fabulous value, vast coal fields, rich fisheries, valuable fur-bearing animals, extensive forests and thousands of acres of fertile land suitable for farming and stock raising. The climate is not all Arctic in character but varies from the temperate in the south to the frigid in the north. The Japan current so "modifies the latitude," that south and southwest Alaska are very little colder than the Puget Sound country.

Agriculture in Alaska is only in its infancy, but successful experiments have proven that in much of the territory south of the Yukon, the hardy grains, grasses and vegetables can be successfully grown. The Seward Peninsula and Arctic Coast regions have few agricultural possibilities, but at a station 68 degrees north, within the Arctic Circle, potatoes, cabbages, turnips, rhubarb, etc., are grown of good size and excellent flavor. In this part of the territory there is developing a novel stock industry that may make Alaska the meat producing country of the Northwest. About fifteen or twenty years ago, a number of reindeer were brought here from Siberia by the government. These have increased until they number twenty thousand. They find their own living all the year, in the winter digging in the snow for the reindeer moss. The flesh is excellent food. and the natives use the skin for clothing. It is estimated that Northwest Alaska can furnish winter pasture for 8,000,000 reindeer. The increase is very rapid, about 33 1-3 per cent yearly.

In the Tanana Valley over 30,000 acres of land has been homesteaded and there are a number of good farms. Near Fairbanks there are several hundred of acres warmed by hot springs. Here the tender vegetables, tomatoes, melons, etc., are grown. In the valley of the Copper River, in the Prince William Sound country and around Cook Inlet are thousands of acres of native grasses, often three, four or five feet high. These grasses are sweet and nutritious and make excellent feed for cattle. In most localities they can be cured for hay. Where wild grasses grow so luxuriantly it is probably only a matter of time when the tame grasses will be established. It is thought alfalfa and white clover would do well, for in some places the wild pea covers the hillsides and often along the roadway thrifty clumps of white clover with its snowy blossoms smile a welcome to the traveller. Wheat, oats, barley and rye come to maturity in some localities. In other sections they are grown for hay. Berries of all kinds—blueberries, raspberries, strawberries, salmon berries, cranberries and currants both black and red and of good size and flavor are plentiful. In some parts the wild crab apple grows. Most of the vegetables grown are crisp and good, and yield well. The seasons are short, from four to six months according to locality, but in the long hours of daylight and sunshine everything grows with surprising rapidity.

It is thought by some that dairying might be made profitable, for butter and cheese are compact products, and they use the rough forage, hay and root crops, and furnish labor for many hands. Experiments have been made with silos and they are said to be successful. This will take care of the green crops and all that do not ripen. Stock will have to be fed for five or six months, but that does not make stock raising in Alaska an impossibility, for in part of Minnesota cattle are fed six and seven months and a profit made. But it is no easy matter to open a farm in Alaska—labor, patience and time are required. First the land must be cleared of timber, then in many places there is the "tundra," thick clumps of moss that have been there for ages, which must be grubbed off, and gotten rid of in some way. When the soil is "new," sometimes it is "sour." It will take time to "tame" it, and make it ready for cultivated crops, and the seeds, many of which must be acclimated. It is thought seeds from northern Europe might do well. Money and labor, patience and time are needed in large measure to fit Alaska land for cultivation. Probably this territory will never be a great agricultural country, but there is little doubt but that in a very few years, Alaska will be furnishing food stuffs for a large part of its population. Even now the home grown products are making a showing. In 1906 there were 211,215 bushels of potatoes shipped to Alaska. In 1908, only 167,033 bushels. In the same time the hay shipments were less by 1200 tons, while the number of cattle and horses had increased.

Heretofore lack of transportation facilities has been one of the great drawbacks to the development of Alaska, but now several great steamship lines are competing for the trade. One of these, the new Alaska Steamship Company, the largest line operating exclusively in Alaska, has sixteen large steamers that run regularly to Alaskan ports. In the interior the thousands of miles of navigable rivers and several hundred miles of government roads are being supplemented by railroads that are building in several parts of the territory. One to the Matanuska coal fields and another in the Copper River country are the most important ones. The Copper River road, with its sea terminus at Cordova, has over sixty miles of road in operation and will keep the men at work all winter pushing on to the interior to the great copper mines. The same company is building a branch line to Katalla, to reach the great Bering River coal fields.

---

The most convenient stable is the most economical stable. You cannot afford to ignore the advantages offered by modern invention.

## Forestry

### EARLY PLANTING FOR EUCALYPTUS GROVES.

AN old adage, "Prune when the knife is sharp" may be more generalized and, indeed, become axiomatic in some such phrase as this, "Agricultural operations have no fixed time."

According to the theory of horticulture, which has been expounded in numerous more or less ponderous volumes, the operation of grafting should be performed just when the sap begins to get active, or when the buds begin to swell. To carry this out faithfully, owing to weather conditions, may be quite as difficult as to answer the question, "What does an egg-plant bear?"

A propagator told me, a year or two ago, that he always made a point of getting all his grafting done before Christmas; and he invariably had an almost perfect stand.

Where weather conditions are extreme, as in the Eastern states, it is very easy to make arbitrary rulings as to the time when certain work should be done, and when one moves to a kinder climate the force of habit is stronger than the desire to change when under different environment.

It is so with planting. In the East it is the universal custom to look upon the spring as the season of year when the ground should be stirred, and all transplanting attended to. Of late years, however, the nurserymen have endeavored to encourage fall planting of hardy trees, but, in either case the season is arbitrary, owing to the rigor of mid-winter.

Not so in California, however, where the planting season extends from the first of November to the first of May, obstructed only by the occasional rain storms which render the land temporarily too wet for working. This long season is extended to the utmost by the very commendable practice of fall or summer plowing, opening the soil, and making more readily available even a light rainfall, which will permit the harrowing and levelling preparatory to early planting.

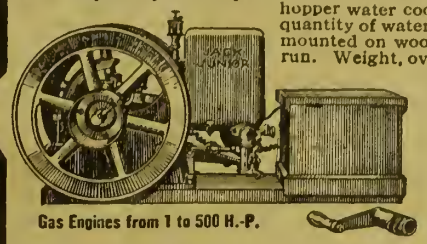
Particularly is this desirable in the case of the planting of eucalyptus forest groves, and for the following reasons:

1. The ground is in better condition and will not become packed as it would after the winter's rainfall.
2. For extensive planting it is often extremely difficult to obtain the necessary help at the proper time if the work is deferred until spring.
3. Planted early, the eucalyptus seedlings are making root growth all the winter, and are in consequence much better able to withstand the heat and drought of the first summer, however well they may be cultivated. Irrigation, even where rainfall is light, may often be dispensed with if plants are set in the early winter, and well cultivated. No specific instructions, however, may be given in reference to this last point, some soils retaining moisture much more naturally than others.

Properly hardened plants which will not stand the first winter's frosts without serious injury should not be planted at all. In other words, the wrong species have been selected. This is a matter of detail and technical knowledge about which there should be no element of speculation. The information as to suitable species for a given locality is easily obtainable, from those who have had the experience.—Leonard Coates, Morganhill.

**Perfect One Horse-Power Engine**

This great pumping or power engine is within the reach of every countryman's pocket-book. At last farmers can obtain a one horse-power high grade **Fairbanks - Morse Engine** at a very low price. "Jack Junior" is a four cycle gasoline or kerosene engine with a hopper water cooling jacket, which does away with the large quantity of water for cooling required by other engines. It is mounted on wood base, complete with battery, all ready to run. Weight, over 300 pounds.



Gas Engines from 1 to 500 H.-P.

Don't confuse this sturdy worker with toy air cooled engines made merely to sell. **Jack Junior** is as durable and reliable as the highest priced engines you can buy, and should give perfect service for years at less than 1 cent per hour for fuel. Will run any machine that does not require over one horse-power. Will pump more water than any ordinary windmill. Cut out advertisement and send for big illustrated Engine Catalog No. BC 1034 Pumping Engines, Pumps, Pump Jacks, Electric Lighting outfits, Saw Frame, Grinders, Shellers and Supplies.

Fairbanks, Morse & Co., San Francisco, Cal.

# Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Sores on Cow.

I feed my Jersey cow two pounds bran, two pounds alfalfa meal and two pounds middlings each day, I make two feeds of it, and feed it moistened. She is staked in a field of oat stubble for her hay. She gets plenty of stubble, but not much grain in this field. A month ago she apparently licked the hair off her belly in four spots right in line from the udder to the forelegs along the center; I made a paste of lime and water and applied and covered with a sack. The sores have dried up but a short time afterward the same condition appeared at the juncture of the udder and belly and also in the crevice between the forelegs and chest, also a little later, on her neck, and now around her teats on the udder and even on the teats there are numerous pimples that look like prickly heat. These places seem to itch and although I have applied the lime paste time and again, she constantly licks it off and then the spots that she can reach, become sore. Her milk supply is not regular.—W. C. D., San Jose.

I should suspect the character of the feed might have something to do with this cow's trouble. If the oat straw is coarse and brittle it is not easy of digestion and does not make long material that a cow can cud into a mass for chewing. If ten pounds of alfalfa hay could be substituted for the alfalfa meal it would be better. This alfalfa hay could be placed in a clean box and made wet, then covered with sacks over night to soak and swell a little to make it succulent. If this can not be done secure a few pumpkins, pig melons, or beets to add to the food, a load of corn stalks or something that can be moist. The cow should have abundance of water even to making her bran into a slop to produce milk on this dry feed. I never saw but one case like this. A neighbor had a fine Jersey cow for which he paid a large price. The local doctor, this was ten years ago, shared the prejudice against alfalfa. He told these people the baby would die if the cow was allowed to eat alfalfa in any form. The cow was staked on grain stubble and feed on middlings. The owner told me one day if I would like to have Bessie I could for she had broken out in sores and he was going to shoot her. I sent for her and she was a terrible looking object. She was put right on green alfalfa in a small lot. Each morning to a small amount of barley was added a tablespoonful of bisulphite of soda. The sores were washed with per-oxide of hydrogen and then dusted over with powdered charcoal. Corn silage and pumpkins were fed to her, all she would eat, and only two pounds of rolled barley was given each morning. In six weeks I was able to return her to her owner in perfect condition. They again tried to feed her according to the doctors orders and she became as bad as ever with running sores. As I was not a Jersey breeder I did not care to have her in the herd, so another man took her and after coming over to see how we had cured her up, repeated the treatment with the same good results. Add succulency and some long stuff to this cow's feed. Washing of the sores carefully should cure her up if she has not some chronic troubles within her blood. Try this bi-sulphite treatment for the blood at the same time.—M. E. S.

### Age of Walnut Trees.

I have opportunity to purchase a walnut grove in fairly good condition. Some trees show dead wood at the top and others are very thrifty. They are fifteen to twenty years of age, and I wish to know if their bearing life is almost over, or is the walnut a long lived tree?—C. J. E., Hynes.

This was referred to Mr. J. B. Neff of Anaheim, who writes:

There is no reliable information as to the life of softshell walnut trees on this coast, but it is reasonable to suppose they will live to a great age if the conditions are suitable. Trees are known in the south of France that are 300 years old and are producing as much as 400 pounds to the tree. These are roadside trees that have plenty of room. The best orchard that I know of was planted in 1879 and has been thinned out until the trees are now 55x65 feet apart. The trees are hardshells and are vigorous.

Walnut trees on good land should not be much closer than 60 feet apart, though if planted in 60 feet squares a tree may be planted and grown in the center of the square for the first 15 years, if the land is well fertilized.

### Sweet Potatoes—Peanuts.

How can I keep sweet potatoes through the winter? Should peanuts be harvested before the vines are dead, and how are they cured? Are the vines good feed?—A. B., Inglewood.

As to the storing and keeping of sweet potatoes, we re-print the following written by Mr. Lobingier in answer to a similar query about a year ago:

Any method that will keep the potatoes dry and at a temperature nearly uniform will succeed. In well drained sandy loam I have kept them perfectly in the ground where they grew. For a small quantity, I have been very successful in keeping them in perfectly dry sand in the barn. But no method known to me will keep over winter sweet potatoes that have been carelessly or roughly handled. They are very susceptible to bruising, and while it may not show at once, it will be very apparent before spring. They should be dug before frost has killed the vines, and handled as carefully as you would handle eggs. Allow them at least a day in the sun to dry before putting them away. It is a disputed question among growers whether it pays to store for a higher price—many are of the opinion that the risk from decay more than equals any advance in price.

Peanuts should be harvested before the heavy rains set in, so that they can be properly cured, which is usually done in the field. We do not think there would be any advantage in placing them in the shade. They are harvested in much the same way as the lima bean crop. The sled cutter takes off the tap roots underneath the surface of the ground. This loosens the soil and the nuts are practically all saved. The vines may be left in windrows 24 to 72 hours according to the weather. They are then piled in cocks about the size of the ordinary hay cock, each vine being lifted singly with fork and handled carefully so that the nuts do not drop off. Cure in cocks six to twelve days, after which the nuts may be picked off. Price for picking ranges from thirty to forty cents per sack holding about 40 pounds. The vines make an excellent feed for hogs and cattle, but are not considered so good for horses.

# CUTTER'S
**Anthrax and Blackleg**
# VACCINES

Are given the preference by 80% of California Stockmen because they give better results than others do.

Write for prices, testimonials and our NEW booklet on Anthrax and Blackleg.

**The Cutter Laboratory**
**Berkeley, California**

When to be used for feed, they should be hauled in the morning or when fairly moist so that leaves will not drop off leaving only bare stems.

### Cover Crop.

What is the best cover crop for clay wash soil? I have walnut ranch at the foot of Rincon Mountain, with deep soil which I irrigate.—J. F. Tubbs, Carpinteria.

We do not think you could find anything better than the vetch or Canadian field pea, and if you can irrigate, we would suggest immediate planting. Fit the ground by irrigating heavily and then drill in the seed, leaving surface so that you can irrigate later if sufficient rains do not fall. If you plant the vetch, you will need to drill in about 40 pounds per acre between trees. Sixty pounds of the field peas would be required. Should you prefer fenugreek, which is hard to get and more expensive, you will find 16 pounds sufficient. Some prefer the ordinary native burr clover. For further particulars regarding green manure crops, we would refer you to the issue of September 9th which was almost entirely devoted to cover crops.

### Gum Disease.

I have several orange trees which have gum disease. I cleaned off the bark and applied mixture of neats foot oil, one quart, with two ounces of crude carbolic acid. Two of the trees died after the application, but others are doing well. Were trees killed by the disease or by the remedy applied? The gum is two or three feet above the ground.—Subscriber, Anaheim.

Gum disease is considered a purely physical trouble caused by improper soil conditions produced by soaking of heavy soil and formation of hardened case around the roots, thus preventing growth and proper nourishments of the tree. The only remedy in such a case is to correct the soil conditions, which may be done by cultivation and heavy mulching, or as is sometimes done, digging out the hard crust of soil and filling in with sand or sandy loam. Slitting of the bark has sometimes been practised and found beneficial. Description of this and similar diseases and remedies may be had by writing to the College of Agriculture, Berkeley, Cal. for Bulletin No. 200. It is not probable that the remedy you applied was the cause of the death of the trees. It was more likely the disease or condition itself.

### Naming of Apple.

Mr. N. S. Southmayd of Gardena, left with us for naming samples of apples which he said were of exceptionally fine quality. The trees had been sold him for Missouri Pippins. He wished to purchase more trees of the same variety as they were well adapted to the Gardena section. The tree is of spreading growth with long slender branches.

This apple was submitted to one of the best experts in Los Angeles, and he was unable to positively name it. It was then sent to C. H. Rodgers, President of the Pajaro Valley Apple Growers Association, Watsonville, who writes: "The apple which you sent for classification is the Arkansas Beauty. It is a delicious apple and a good keeper. To secure good color and high flavor, it should not be picked until the latter part of October."

### Canker-Worm Trap.

Would traps made of builders' tarred paper, or manila paper soaked in linseed oil, be a sufficient safeguard against the ascent of the female moth of the canker-worm into prune trees; the tarred paper to be used in lieu of usual traps of No. 16 mesh wire cloth, and tied around the trunks, cornucopia shaped mouth downward, somewhat as paper is used to prevent cut-worms from climbing into small fruit trees? That is, could the wingless moth climb around the slant of a paper trap so made, and would the tar or linseed oil be likely to preserve the paper from collapse in the rains during the period of oviposition, the object being, of course, to make a trap cheaper and more convenient to apply than the wire mesh?—Prune Grower, Morganhill.

The linseed oil would preserve the paper and prevent its collapse during rains. If you paint the lower inside edge of the paper, say a couple of inches wide, with tar or a mixture of rosin and honey or syrup applied hot, this will catch any insect that tries to cross it.—J. W. M.

### Grapes Not Fruiting.

We send you bunch of grapes showing only six well formed grapes, many others of all sizes from full grown down to the size of large pin head, with the greater number of the blossom stems blighted, growing no fruit whatever. Can you give cause and remedy?—Subscriber, Morganhill.

The grapes sent were a white variety, either Burgher or a similar fruit. They were referred to Mr. Mills of Marysville who writes as follows:

The description of the poorly formed bunch would indicate either Anaheim disease or mildew at an early stage checked by sulphuring. There are sometimes single vines in a vineyard that produce many small grapes. Had the subscriber given more particulars we could tell more about it. If his entire vineyard or a part of it is so affected, he should spray late in the winter with Bordeaux mixture and apply about a quarter of a pound of nitrate of soda per vine just before blooming time.

### PRIMER OF IRRIGATION.

A Primer of Irrigation by D. H. Anderson, Editor of Irrigation Age, issued by the Anderson Publishing Co., Chicago, is a valuable new book for every irrigator. The Cultivator has arranged to supply its subscribers with this book at $2.50 per copy including a year's subscription to the Cultivator. It contains twenty-two chapters of varied information; constitution of the soil, soil characteristics and uses, fertility and sterility, adaptation to various plants, origin and nature of alkali soils—how to reclaim—also practical methods of laying out land, different forms of irrigation, quantity of water required for various crops, how to measure water, etc.

It is a good book for the shelf of every irrigator.

The annual entomological inspection on plantations in the Hawaiian Islands was commenced last month. The cane borer which has proven a serious pest in the sugar plantations, has been less numerous this year than in the past.

Asotin county, Washington, claims to be the banner cherry producer of the world since her recent winnings at the A-Y-P Exposition.

# Classified Liners

Rates 1½ cents per word per issue No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

## MISCELLANEOUS.

THE ANCHOR EGG SEPARATOR works perfectly; no well regulated hotel or household can afford to be without it." So says Delmonico's Chef. Send ten cents or ten names of persons keeping poultry, and we will send one postpaid. Or for 25 names we will also send postpaid "THE POULTRY MANUAL" by those high authorities, F. L. Sewell and Ida R. Tilson, profusely illustrated. WEST COAST MILL CO., 705-709 So. Griffin Ave., Los Angeles, Cal.

A LABOR SAVER FOR WOMEN. Send 10 cents for three weeks trial. Electric Laundry Compound, washes clothes without rubbing. Saves time, labor, and clothes. No lime, lye or acids. Eight washings 25 cents. Money back if not satisfied. ELECTRIC COMPOUND CO., 823 S. Spring St., Los Angeles, Cal.

FORTUNES IN SUGAR—STOCK FOR sale in a new sugar cane plantation. Small monthly payments will secure for you an interst in this great enterprise, that will pay you an annual income for life. Write for booklet, LOS HORCONES PLANTATION CO., 724 Grosse Building, Los Angeles, Cal.

PRODUCER TO CONSUMER—Write to me today for prices on dried fruits. We raise them and Banning fruit is of the best. If you like fruit, our prices are low enough, you can afford to eat fruit the year round. Write now to CHAS. W. MIXTER, Banning, Cal.

HEALTH—LATEST SCIENTIFIC DISCOVERY. You positively can renew your youth and prolong your life. Our book "How to Live 100 Years" and 15 sheets of instructions for 50 cents. NATIONAL HEALTH LEAGUE, 545 Douglas Blk., Los Angeles, Cal.

A GOOD INVESTMENT. MOST MEN are working for money. The wise man makes his money work for him. Write for prospectus. COLUMBIA COMMERCIAL COMPANY, 204 East 9th street, Los Angeles, Cal.

## HORTICULTURAL PRINTING.

THE KRUCKEBERG PRESS, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure; a personal visit a joy. Headquarters for catalogues and quadri-color printing.

## RUBBER STAMPS.

SEND IN YOUR ORDERS FOR RUBber stamps, dies, stencils, etc. Catalogue on request. F. W. HOPKINS PTG., CO., 641 S. Main St., Los Angeles, Cal.

## POULTRY.

FOR SALE—RHODE ISLAND REDS (Tompkins Strain), Rose and Single Comb Black Minorcas (Northrup Strain), White Minorcas. Day-old chicks hatched to order, and eggs in season. C. U. CHAMBERLIN, Los Gatos, Cal.

A FEW CHOICE COCKERELS FOR sale from heavy laying trap-nested hens. For prices address MRS. A. J. BADGER, Oxnard, Cal.

PIT GAMES—SOUTHERN AND GRADE Japs. O. L. CRANE, Route 3, Santa Rosa, Cal.

## FERTILIZERS.

SULPHATE OF POTASH
$60.00 per ton.

For a short time we will sell Sulphate of Potash at $60.00 per ton.

This is the right time to apply it for maturing the crop and the new growth of wood.

This price won't last. Get your supply now from the Armour agent in your district.

THE ARMOUR FERTILIZER WORKS, Los Angeles and Colton.

## HARNESS.

THE MOST RELIABLE HARNESS manufacturers in San Francisco will make to your order any kind of harness you may want from the best stock, at wholesale rates, all goods guaranteed as represented, or money returned. We carry large stock of our make harness on hand for immediate shipment. Write for catalogue. LASTUFKA BROS. & CO., 1659-61 Market St., San Francisco, Cal.

## HONEY.

SAGE HONEY, GUARANTEED ABSOlutely pure. One 5 gal. can, crated, f.o.b., $4.25, two 5 gal. cans, crated, f.o.b., $8.00. HENRY E. HORN. Riverside, Cal.

## DOGS.

FINELY BRED PEDIGREED SCOTCH Collie puppies, perfectly marked. Also exceptionally handsome dog two years old. ELIZABETH CUMMINGS, Oxnard, Cal.

BLUE BLOODED ROUGH COATED Scotch Collie puppies, perfectly marked in sable and white. Stock workers a specialty. RANCHO CALAO, Mountain View, Cal.

## HOGS.

REGISTERED BERKSHIRE AND POland China hogs, both sexes. C. A STOWE. Stockton, Cal.

## RHUBARB.

FOR SALE—WINTER CRIMSON RHUbarb. Established roots, $5.00 a hundred. F. T. HAWLISH, Greenfield, Cal.

## BEES.

75 COLONIES BEES FOR SALE. Best hives, straight worker combs, full equipment of top bodies, comb honey supers and necessary implements. M. H. PHILLIPS, Glendora,

## FARM LANDS FOR SALE.

FOR SALE: 145 ACRES CHOICE Orange land; red soil; water at 20 feet; 1 mile from town site on S. P. R. R. in Tulare Co., in orange territory; $75 per acre; easy terms. Other lands near town site at $100, in 10 acre lots. Prairie lands on West Side in Fresno County not improved at $12.50 to $25 per acre, 160 acres or more. WM. PARAMORE, 433 Mason Bldg., Los Angeles, Cal.

## HOMES FOR CHILDREN.

HAVE YOU A BOY? IF NOT, LET us send you one. We want country homes for boys of all ages. Arrangements to suit. CHILDRENS' HOME SOCIETY, 2414 Griffith Ave., Los Angeles, Cal.

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point!"
MORE LIGHT
—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.
THE ANGLE LAMP
resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week.
Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.
Boesch Lamp Co. 1135 Mission St. San Francisco
Established 1869. Incorporated 1890.

# California Genuine Sardines

## Not a Substitute, but a Genuine Sardine

They have all the old time Sardine qualities. Delicious in flavor, a wholesome, nutritious food. You will prefer them to any you have ever eaten.

**PROFESSOR DAVID STARR JORDAN,** President of Leland Stanford University The leading authority on fishes of the Pacific Coast, writes of the California Sardines, in "Fishery Industries of the United States," 1894, page 569: "This species is everywhere known as the Sardine or by the Italians as Sardinea." It is in fact almost identical with the sardine of Europe.

### Your Only Protection

against substitution lies in becoming acquainted with our brands.

### Don't Ask for a Can of Sardines or California Sardines

But ask for any of the following brands and insist upon getting them:

### Put Up Only Under These Brands

| BRANDS | STYLES | BRANDS |
|---|---|---|
| Goldfish | Ravigote | La Rouchelle |
| Sunset | Le Croix | Mission |
| Senorita | Boneless | Sunset |

If your grocer does not carry them in stock write us.

**CANNERY, SAN PEDRO, CAL.**
The only Cannery of Genuine Sardines in America that is operated 12 months in the year in the same line of business.

**Five Colored California Post Cards Free**

**California Fish Co.**
116 Henne Bldg.
Los Angeles, Cal.

# SECURITY SAVINGS BANK

**3% On Special (Ordinary) Savings Accounts**
Which Accounts may be checked against without presentation of Pass Book. Interest is paid monthly on the minimum monthly balances.

**The Safe Deposit and Storage Department is the largest and best equipped in the West**

# Household Department

### THE DESERT SHOWER.

A cloud crept up o'er the desert;
And none was there to see;
To long for the spray on that desert way,
Or pray its waters free.
No herb lay parched in the burning
To crave the cooling shower;
No withered blade, to bless its shade,
No eager, upturned flower.

Beyond, in the land of verdure,
Broad fields all thirsty lay,
And they sent a cry to the arching sky
To swing the cloud that way;
"We have fruits and grain that languish;
The desert needs you not.
She will drink your rain and will nothing gain,
Cloud, shun the cursed spot."

The cloud swung low o'er the desert,
Nor heard the green field's call,
But upon the sand of the thirst-cursed land
It let its waters fall.
The sands, as the fields had uttered,
Drank deep of the potion cool,
Save one stony spot which drank it not
But saved a tiny pool.

Next day a fainting, thirsting man,
Lost on that desert plain,
Voiced to the air a woe-fraught prayer
Of agony and pain.
And lo! his prayer was answered,
For there, just at his feet,
His life to save, the boon God gave,
The pool of waters sweet.
—Sunset Magazine.

### IN THE INTERESTS OF TRUTH.

"I'M glad it's over," sighed the maid of honor. "Of course it's been lots of fun, but I'm tired enough to rest now. Summer weddings are so trying."

'She was a very pretty bride, wasn't she?" said the best man. "George is in luck."

"She always was the prettiest girl in our crowd," said the maid of honor.

"That's a matter of personal opinion," he said slowly. "Were you frightened when you walked up the aisle?"

"A little, but I was so busy wondering whether Marion's train would catch on something that I didn't realize that I was starting up the aisle until I was there."

"If that isn't like a woman!" he cried. "To think of a dress while taking part in such a solemn thing as a wedding!"

"I don't believe you were any better!"

"Oh, yes, I was!"

"I dare you to tell me of what you were thinking when you went up that aisle!" she said. "I warrant that you were just as frivolous as I."

"If I thought you'd hear me through I'd tell you," he said earnestly. "You've never given me a chance to say what I've wanted to say on a certain subject, you know."

She started to reply, but thought better of it, so he went on.

"When a man's in love with a certain girl he's very likely to think of her at a wedding," he said. "Therefore, the natural thing was for me to wish I were the bridegroom myself."

"I didn't know you cared so much for Marion."

"As much as what?"

"Wanting to be the bridegroom, you know. I'm sorry you take it so hard."

"You know very well what I meant. You're just plaguing me."

Oh, no, I'm not. I wouldn't for the world."

'Yes, you would! You take delight in making me miserable."

"If you're going to talk like that we'd better go where tne other guests are."

"I'm not going back yet," he said, masterfully. "If you go back alone it will look queer, so you'd better be good and listen."

"I may have to stay, but I don't have to listen."

"You can't help yourself. As I was saying, if a man thinks the world and all of a girl he naturally has her in mind when he's going up the alsle at another's wedding. I determined some time ago to make you give me an answer tonight, for you've played with me for weeks and I'm not going to stand it any longer."

"How fierce!"

"You've known a long time that I was in love with you and—"

"I'd like to know how I was supposed to know that. You never said a word to me about it."

"I don't know how you knew," he said, vaguely. "But you did. Girls always do. Besides, I was here often enough to give you a hint."

"Other people have been here, too."

"Oh, I know that only too well. That confounded Tucker—"

"He's a friend of mine, remember."

"That's just the reason I have no love for him. But that's neither here nor there. What I say is that I must have an answer from you at once."

"In books such a declaration is followed by the announcement that the hero is on the point of leaving for India or the Philippines."

"I'm not," he said, gloomily. "I'm not even going to have any vacation worth mentioning, while you are going away to be the beauty of several summer resorts and have all the fellows devoted to you."

"Just like the funny page in the paper? Surely you don't begrudge me so much joy."

"Not in the least, if you'll give a few minutes' thought to me once in a while. You see I— Well, hang it! can't let you go without knowing whether you care for me or not. What do you think about it, anyhow?"

She gave him a quick look. "I don't think," she said softly. "I know."

After a time she insisted that they must join the others.

"Tell me first," she said, "just what you were thinking when you went up the aisle?"

"I was wondering," he confessed, sheepishly. "why my left shoe squeaked while my right didn't."—Chicago Daily News.

### A JAP AD.

The following is a bona fide ad appearing in the Fresno Republican some weeks since. It sure is the genuine article and bears no mark of being the work of an imitator:

LOST DOG—Reward $5 to any one who finds a lost dog between Fowler station and Manakah, last night. Gray little female dog, two feet long, one foot high, two years old, had baby two weeks ago, has big wimple. Phone China 762. Matsuyama, 935 F St., Fresno.

## CARE OF LACE CURTAINS.

EVERY precaution should be taken to keep the curtains clean as long as possible, as it is the washing that wears them out much sooner than the using. Your lace or muslin curtains will keep clean twice as long if you will lift the curtain poles from the brackets and lay them, curtains and all, in another room when you are about to sweep, as no dust will settle on them.

Lace curtains that are only slightly soiled can be freshened by soaking them for two hours in gasoline, but the only safe place to use it is out of doors. Shake and brush the curtains carefully, then put them in a small tub and pour enough of the fluid over them to saturate them thoroughly, then cover the tub closely to keep the fluid from evaporating. Hang them over the line and press carefully, and if they have become flimsy, they should be gone over with a cloth wrung out of thin starch water and pressed as fast as dampened.

When the curtains are soiled enough to be washed, they can be cleaned with very little rubbing, by shaking them well to remove all dust and then rinsing them through clear warm water. When they are removed from this water, put them in a tub of warm, soft water in which a small cup of kerosene oil has been stirred and let them remain over night. In the morning squeeze as much of this water out as possible and rinse them through clear water and then wash them through a strong hot pearline suds by lifting up and down and pressing and squeezing between the hands and they will need no boiling unless they were very soiled.

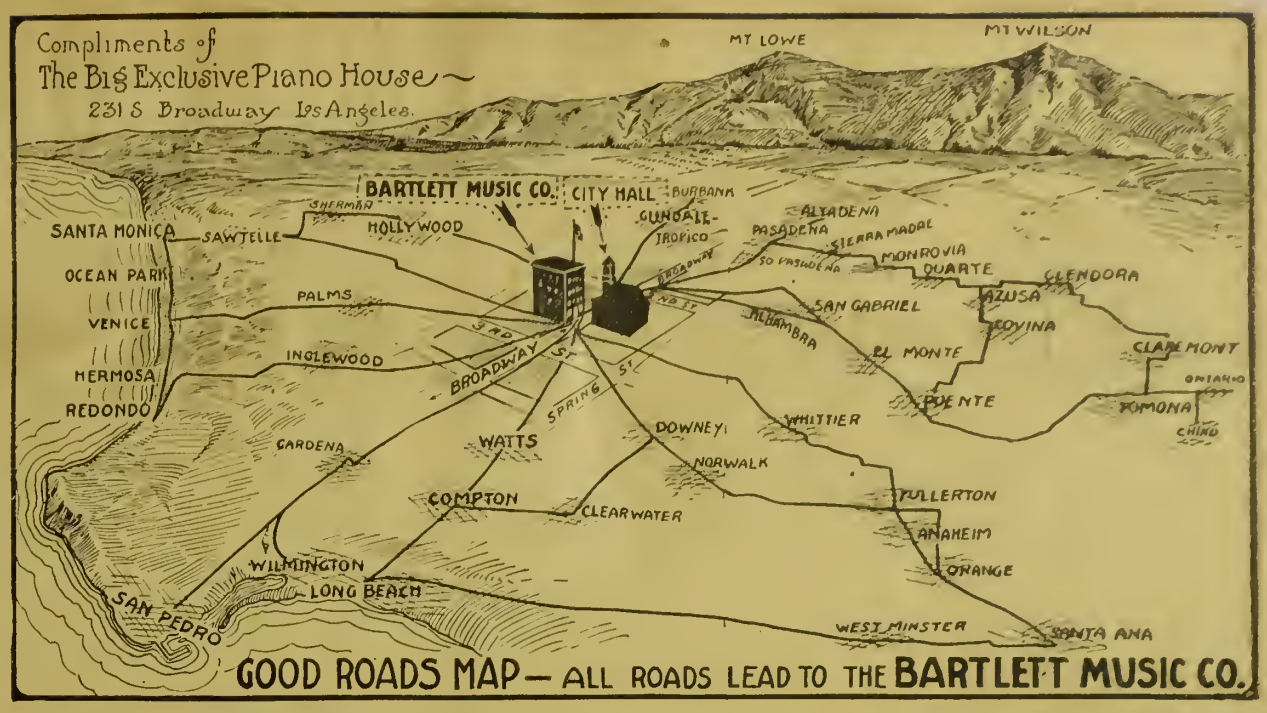
The finest curtains can be washed in this way without any injury to the fabric, and if the work is carefully done, the curtains will come through the process looking beautifully clean and fresh.

To make the curtains a pretty cream color, dissolve a tablespoonful of yellow ochre in a little water and add to the starch, being careful that it is quite smooth, and also add a little gum arabic which has been dissolved in warm water to the starch. This quantity of ochre is enough for one pair of lace curtains, and they never fade when colored in this way.—M. H.

## TO SAVE CONFUSION WHEN MOVING.

If you are planning to move, prevent confusion in placing furniture in the new house in the following manner: In leisure moments prepare a large card for each room, to be tacked to the outside of the door-frame on moving-day. Assign a number and mark a card for each bedroom. Letter the other cards with the names of the other rooms. Then prepare a number of smaller tags, attaching a string to each (or use baggage-tags). Mark enough to put on all furniture, trunks or boxes with the name of the room into which each is to be put. Show your movers the arrangement, and there will be little or no error in placing, while no valuable time and strength will be lost in directing.—Woman's Home Companion for October.

"Give men their gold and knaves their power;
Let fortune's bubbles rise or fall;
Who sows a field or trains a flower,
Or plants a tree is more than all."



THE SAVINGS AND LOAN SOCIETY
101 MONTGOMERY ST.
SAN FRANCISCO

Many people postpone opening a savings account until they have a round sum. This bank specially invites small deposits and is daily opening a large number of accounts of one dollar and upwards.

### Hay.

Scott, Magner & Miller say:

Arrivals of hay in San Francisco for the week ending today have been 3500 tons. This shows somewhat less than we have been receiving for the last few months. However, it is a large amount, comparatively, to handle here at this time on account of the market having been overburdened with the large consignments of hay that have been rushed in here during the last few weeks.

The rains that we have had, did considerable damage to hay that was piled in the fields, and somewhat of this hay has been shipped in to San Francisco, and has been handled with considerable difficulty and dissatisfaction. There is not much horse hay left in the fields, and we expect to be entirely cleaned up very shortly.

Arrivals of alfalfa hay have been heavier, the demand very moderate, and prices somewhat easier. Damaged alfalfa hay will prove a heavy drag on the market, and difficult to dispose of at satisfactory figures.

This week's quotations are:

Choice wheat hay .....1900@20.00
No. 1 wheat or wheat & oat 17.00@18.00
No. 2 wheat or wheat & oat 14.00@15.00
Choice tame oat .....16.50@17.50
Other tame oats .....14.00@15.00
New crop wild .....11.00@15.00

Middlings .....36.00@37.50
Mixed feed per ton .....28.00@32.00
Shorts .....31.50

## Citrus Market

LOS ANGELES, Oct. 13, 1909.

Oranges are commanding a very slight advance in price though the principal feature in the market is a stronger tone which more quickly cleans up the various offerings. Another two weeks will see the entire Valencia output cleaned up.

Tulare county navels are already coloring and it is thought a good showing of Thanksgiving fruit may be made, at least the season is considerably in advance of last year. Sizes now promise to be good.

The lemon market is still exceptionally strong. Big prices are being commanded and every offering is quickly picked up. Shipments are very light.

### SHIPMENTS.

Total shipments to date this season are 37,498 cars, of which 31,434 were oranges and 6,064 lemons.

NEW YORK, Oct. 8.—Five cars oranges sold. Market firm on good stock. Weather clear and warm.

# Veterinary

Answers in this column by Dr. R. T. Whittlesey, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Sore On Leg.

Sore started under fetlock on hind leg about two months ago and has spread until leg is a raw sore from hoof to ankle almost all the way around. Leg has swollen to a little above the hock and I am unable to stop spreading. How can I treat it?—W. T., Buttonwillow.

I think it has spread from the use of too strong medicines, like a strong solution of carholic acid. My advice is to use the sulphur-arsenical ointment advertised in connection with this column, hut if you do not want to go to any expense, try a saturated solution of sulphate of copper and water. Wet a pledget of cotton large enough to cover the sore and hind it with a long roller bandage, changing once daily.—R. T. W.

### Wind Gall.

Can you suggest anything to reduce win gall on horse's knee?—W. H. C., Ramona.

These wind galls are filled with fluid, and there are several methods of treatment. Injections of iodine, painting with iodine, and bandaging snugly, sometimes reduce the enlargement. It may also be punctured with a hot sharp pointed iron. The best treatment for you to follow is probably to paint with iodine and bandage with dry cotton.—R. T. W.

### DR. WHITTLESEY'S VETERINARY REMEDIES.

These are not ordinary mixtures but are from well tried formulas, used in an extensive practice in Southern California for nearly a quarter of a century. Dr. Whittlesey's Sulphur Arsenical Salve for deep fistulous or ordinary chronic, indolent sores such as, "Poll Evil," "Fistulas," "Quitters," "Thrush," "Scratches," "Warts," "Collar sores" or "Sit-fasts," $1.00 per package postpaid. Printed directions. Dr. Whittlesey's Antiseptic Healing Powder forms a coating over raw surfaces, excludes air, flies and floating germs. Makes a cheap and convenient dressing for the many sores that occur to stock on the ranch. $1 full pound can postpaid.

DR. R. T. WHITTLESEY.
Veterinary Hospital, 714 East Seventh St., Los Angeles, Cal.

# Business Notes

### GREAT FAITH IN ABSORBINE.

Another example of what my customers think of my remedy for use on blemished horses is found in the following letter, received under date of March 19th, 1909, from E. S. Jenkins, Center Point, Ind. He writes: "Have been using your ABSORBINE for two years with great success for contracted tendons, lumps, swellings, etc. Had a horse that had been lame for 18 months with strained tendons of the left leg, and two and one-half bottles of ABSORBINE cured him. I have great faith in ABSORBINE for such cases as I mentioned. Have recommended its use to many and have aided the druggist in building up a pretty fair sale of it in our little town. I don't deserve any praise for this, for I feel that I owe it to the medicine to tell my friends of its merits." You would find ABSORBINE equally beneficial and, if you do not already have one of my free booklets, write at once. You can procure the remedy at your druggist's or sent postpaid upon receipt of $2.00.

W. F. YOUNG, P. D. F.,
244 Temple Street, Springfield, Mass.

### MALTHOID ROOFING.

The Paraffine Paint Co. of San Francisco with branches at Oakland, Seattle, Tacoma, Spokane Portland and other cities, has issued a couple of new booklets which are little works of art. One of them is filled with illustrations of buildings at the A.-Y.-P. Exposition at Seattle. These buildings were all covered with malthoid roofing and it is a wonderful endorsement of that particular brand of roofing to see all these beautiful buildings which it covers. The other booklet is a larger one and is filled with illustrations of some of the largest buildings in the city of Los Angeles which have also been covered with malthoid. Amongst these buildings are not only some of the highest skyscrapers, but some of the most attractive residences as well.

Malthoid roofing has been on the market for years, and its manufacture has been encouraged by a rapidly increasing demand—a demand from men in the trade—contractors, builders and owners—the very men who would be the first to reject a poor roofing, and that even more quickly than they would praise a good one.

### WONDERFUL WATER.

Available water is at times worth its weight in good coin. The farmer, the gardener and the worker everywhere need it. For artificial irrigation as well as for pumping and for sinking deep wells and for mineral prospecting, the machinery and equipment of the American Well Works, Aurora, Ill., is second to none. For handling water on a large scale their centrifugal pumps are unequaled. Parties interested should write for special particulars suggesting the name of this paper as advising it to the American Well Works, Aurora, Ill., who will furnish free a large illustrated catalogue of well and pump supplies.

The G. & C. Merriam Company of Springfield, Mass., have just issued Webster's New International Dictionary, based on the International of 1890 and 1900. The revision has been so radical and complete as to constitute a new book. The work has been in active preparation for many years, by a large staff of experts, assisted by the contributions of eminent specialists, under the general supervision of Dr. W. T. Harris, recent U. S. Commissioner of Education.

The title-words in the vocabulary are more than doubled in comparison with the old International, now exceeding 400,000. The number of illustrations is increased to oved 6000. The book contains more than 2700 pages. But the publishers desire to emphasize the quality rather than the quantity of the work, calling attention especially to the thorough scholarship in all departments and the fullness of information under important titles. By igenious methods of typography and arrangement, the increased amount of matter is contained within a single volume, not perceptibly larger than its predecessor, and no less convenient for the hand and eye.

### TAFT OPENS DAIRY SHOW.

President Wm. H. Taft has accepted the invitation of the National Dairy Show Association and will open the hig ten day exposition of the allied dairy interests in the Auditorium, Milwaukee, Wis., Thursday Evening, Octoher 14, by pressing a button in the El Toro Hotel, Grand Canyon, Colo., which will set the machinery in motion. Accompanying the signal which will open the fourth annual dairy show will come a message to the dairy farmers of the United States.

A number of farmers near Clayton and in the Ygnacio Valley are appealing to the board of supervisors of Contra Costa county to abate the nuisance caused by dust from the cement factory which is proving very injurious to a large fruit growing section.

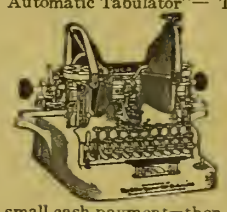
A $100 Typewriter for 17 Cents a Day!

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."



Yours for 17 Cents a Day!

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

A Quarter of a Million People are Making Money With The OLIVER Typewriter

The Standard Visible Writer

The Oliver Typewriter is a money-maker, right from the word "go!" So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

"An Oliver Typewriter in Every Home!"

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

The Oliver Typewriter Company
257 California St. San Francisco, Cal.

# "Without a Peer"

says one of our customers, writing regarding his WESTERN engine. Extract from his letter is given below:

"It pleases me greatly to be able to say that the engine recently purchased of you has more than met our highest expectations. Of its kind, it is my belief that it is **Without a Peer** in all the West.

In the purchase of the engine I carefully looked over the market, had seen every high powered combustion in the State, had given every argument due weight, had fully considered costs of other powers—both as to first cost and cost of operation—and now after a good test stand ready to say that I do not think we have made a mistake in securing your engine."

The engine referred to is of the size and type shown in cut, and is used for pumping water near San Francisco, Cal.

# Conserve the Moisture in the Soil

An Address by J. B. Neff of Anaheim Before the Covina Farmers' Club
October 16th, 1909

IT IS not very generally known how large an amount of water is required for the production of even fair crops. But from the numerous observations, made both in Europe and the eastern United States, it has been found that from 300 tons to as much as 750 tons of water is needed for the production of one ton of dry matter. Enough water to cover one acre one inch deep will weigh about 113 tons, so that if one ton of hay is to be grown on an acre there must be from three to five inches of water applied at the proper time, in excess of that lost by evaporation. The amount used is largely in excess of this as the rains do not come at the most opportune time nor in quantities that will do the most good. The greater part of the water that falls as rain goes into the soil. The amount that runs off without entering the soil varies with the compactness and inclination of the surface and with the character of the rainfall. The free water which forms the visible liquid layers on the soil grains or occurs between them is pulled down by gravity. The water which is held by the soil particles against the force of gravity is called capillary water. It cannot be seen as liquid water, but its presence can be recognized by its effect upon the color of the soil.

In drying weather capillary water evaporates from the surface of the soil, the soil drawing more water from below, but not in sufficient amount to wholly replace that lost by evaporation. There is therefore a continual decrease in the content of capillary water until the next rainfall or irrigation. The free or permanent water may rise in the soil to replace the capillary water lost by evaporation, and it is constantly running off into the natural drainage channels as spring and seepage waters. These several motions of water all take place when the rainfall or irrigation is sufficient to give an excess over what the soil can hold in what has been called the capillary state.

If the surface soil be open and loose, heavy rains completely fill the pore spaces of the upper soil, and when the surface layer is thin it often becomes so soft and filled with water that this loose layer washes and forms the deep cuts which injure so many sloping fields.

It is from the capillary water that plants and trees obtain the greater part of the water necessary to their growth. In order that plants and trees may make their best development the soil must be in such physical condition that the roots can readily penetrate it. It must contain sufficient capillary water to supply the needs of the plants and trees and this water must be renewed as it is taken up. There should be no large air spaces, since these cause the soil to dry out readily and prevent the development of many of the rootlets.

The soil should be porous but not loose; firm but not hard nor consolidated; close grained, but not run together nor sticky. The ideal condition is that of a good loamy soil which has been thoroughly pulverized when in the best condition as to moisture and then firmed by pressure. The pulverizing breaks the soil into granules which the pressure brings together without crushing them. Such soils will take up and hold the most water, not as water is held in a dish, but more as it is held in a sponge. It is free to move under capillary force yet it does not exclude the air.

Proper tillage has two effects. First the soil is brought into the desirable condition already described, so that there will be a deep, mellow, but firm root bed to absorb and store the rainfall and irrigation water, and second, the loss of water from the soil by evaporation is prevented as far as possible. The air is also allowed to penetrate the soil and this is one of the essentials to good growth of plants.

It sometimes happens that there is too much water in small areas of low land in the winter season, from seepage or other cause, and that these lands do not carry the trees through the season as well as the dryer lands. In such cases drainage should be resorted to, in order to get the surface water away so the air may get into the soil and the roots of the plants go deep and be able to withstand the dry weather.

If the soil reservoir has been well prepared and filled with capillary water, cultivation should be directed to reducing the loss of water by evaporation to the lowest possible point. The water that passes through the plants themselves is of benefit to the crop; that which is evaporated from the soil is wholly lost. In spite of all that can be done there will be losses from the soil in drying weather, but these may be materially reduced.

It is well established by the experience of farmers as well as by direct experiments that a layer of loose dry, well granulated soil 3 or 4 inches deep is effective in preventing excessive evaporation. If this mulch be maintained through the season by proper and frequent cultivation it is more beneficial than a straw mulch. But to be effective the cultivation must be done frequently. It is usual to speak of a "dust mulch" but the better mulch has a granular structure and is not composed of dust.

Water is the one element in farming which may be needed to successfully grow an orchard. Such being the case it should all be made to enter the soil. In order to have the water go into the lower soil quickly a deep porous bed should be prepared. This does not mean that the soil should be loose and open with large air spaces. It should be a mellow, close grained mass, without any tendency to become solid or to stick together. In this condition it will take up water readily, which will sink down so as to equalize itself and leave the surface in good condition for cultivation.

The furrow slice is completely separated from the soil below in the process of plowing, and when green manure crops are turned under the furrow is further separated. This loosened soil should be settled to re-establish connection with the lower soil. Evaporation is rapid from such loosened soil, and it should not be left in this open condition where water is so valuable. A weighted disk harrow with the disks set straight so as to cut down into the soil without turning it is very effective in closing the air spaces and firming the under soil. A spike tooth harrow is not effective alone and a roller is not good because of the smooth surface which is left to increase the evaporation. The day's plowing should be firmed and harrowed before leaving the orchard in the evening, if the weather is at all drying. This is very important, as a fresh moist surface loses water to the air rapidly while the surface loosened by the harrow dries out quickly and protects the soil below.

The organic matter in soil increases its water-holding power and improves the physical condition. This is one of the direct advantages of a large supply of humus in the soil. In addition to the application of barnyard manure it will be profitable to grow leguminous crops, such as peas and vetches, for green manuring, as these draw nitrogen from the air and add both humus and nitrogen to the soil.

A rich alluvial farm destroyed by a freshet.

### SOIL INOCULATION.

By Walter F. Sutherst, Ph. D., Bishop, Inyo County.

A GOOD deal of attention has been drawn lately to the process of adding bacterial cultures to seeds and the soil for the purpose of increasing the nitrogen assimilation of the latter, the crops generally utilized for this being the leguminous variety, these having attached to their roots, nodules containing bacteria which have the power of absorbing nitrogen from the air in the soil and by a complicated synthetical process converting it, together with other substances in the root sap, into albuminolds. It stands to reason that the roots of a leguminous plant if not well supplied with these bacteria cannot thrive as well as one better supplied, and if their number in the soil be small, then a poor crop must be expected.

The object of the inoculation is to supply these bacteria either to the seed or soil, in the expectancy that they will eventually attach themselves to the plant roots and by a process of symbiosis, hand over the atmospheric nitrogen in a complete and assimilable form to the plant. All this reads well on paper, but numbers of trials including those carried out by myself, have shown that success is not always ensured, and the reason is not far to seek.

The soil is a "hot-bed" of bacterial life and, except under very unfavorable conditions, contains the nitrogen gathering bacteria, which will, when a leguminous crop is planted, fasten to the roots and carry out their work of nitrogen supplying. Every kind of bacteria has its favorable conditions of life, when its growth and multiplication is at its best; e. g. in warm milk one microbe reproduces so rapidly that in a few hours many millions are produced, but the same placed in water would produce a few hundreds.

All kinds of soil are not favorable for the growth of the nitrogen gathering microbe, otherwise, being always present, they would multiply to their farthest extent and suffice for the largest crop, but once get the soil into a good condition by irrigation, manuring, tillage, etc., then any crop can be grown. A soil not in a fit condition for bacterial growth will never succeed in raising leguminous crops however much inoculation is carried out, and moreover the proper cultivation of a soil will raise of itself sufficient nitrogen gathering bacteria. One of the best media for soil bacteria is farmyard manure, which supplies warmth, moisture and organic matter, all the necessities for bacterial growth and being alkaline and giving off alkaline substances, as ammonia, neutralizes soil acids which are destructive to the nitrogen bacteria. The addition of lime is useful in destroying acidity, but it is of no other use to microbic life.

The apiarists of Ventura county recently met in Ventura and formed a permanent organization for the protection and betterment of the interests of its members. The first step will be to secure the appointment of a bee inspector. A. W. Allen of Santa Paula has been named for the position.

### MANGOES FOR SOUTHERN CALIFORNIA.

In all warm countries of the world there is probably no more popular fruit than the mango, mangifera indica. In India, where it is a native, this tree was brought under cultivation thousands of years ago, and numberless varieties have been originated, in the same way that it has happened with apples, pears, peaches, etc., in the temperate zone.

At Santa Barbara, at Hollywood, and other points of Southern California, mangoes were grown and have been bearing fruit since twenty years or more, but they were never considered more than a curiosity, and no attempt was ever made at testing the possibility of profitable Mango culture in Southern California.

A short time ago, at the request of Dr. Franceschi, the office of Plant Introduction of the U. S. Department of Agriculture asked the superintendent of the government botanical gardens at Saharanpur in Northern India for detailed information concerning the merits of the different varieties of mangoes which are grown in that part of the Indian peninsula.

A most valuable and particularized report from the superintendent, accompanied by a chart where 55 distinct varieties of mangoes are described, has just been communicated to Dr. Franceschi by the Department of Agriculture, for examination and further recommendations on the subject.

Restricting the choice to the most hardy varieties, combining also first quality of fruit, Dr. Franceschi has recommended that eight of the varieties described be imported, and submitted to practical testing in California, there being reasonable prospects that, at least, some of them will find congenial conditions with us.

---

### FIRST CITRUS FRUIT.

The Pioneer Fruit Company is proving its right to its name in being first to make a shipment of citrus fruit from Lindsay this season, and further, in shipping a new variety of citrus products.

This consists of the seedless lime, a variety hitherto known merely as a curiosity. Now, however, this fruit has been brought to a state of commercial perfection and the first consignment though not a large one is shortly to be shipped from John Hedberg's grove near Lindsay.

The fruit is as large as an average lemon and the juice is almost double the strength of lemon juice, therefore we imagine that there should be a good demand for this variety as soon as it shall become well known.

It is well known that lime juice has some very valuable properties, being foremost, a potent antiscorbutic, and exerting generally a salutary effect upon the human system. Lime juice is one of the compulsory items, in England anyhow in the outfit of certain sea-going ships, and no arctic expedition could safely start without a plentiful supply of it. Success to the seedless lime.—Lindsay Citrograph.

---

A Riverside producer has some seedling oranges which have made a growth in five months from the seed of two and a half feet.

## EXPERIMENTS WITH COVER CROPS.

We have a note from Mr. Ben F. Thorpe of Covina touching upon the increasing interest in cover crops. He says the subject seems to be attracting more and more attention from the orchardists of California, especially as the supply of barnyard manure is lessening every year and the price advancing. The cover crop will at least supply the soil with the needed humus and with a percentage of fertilizing matter, just what percentage, the government scientists are now trying to determine definitely. We quote from Mr. Thorpe's letter:

"Those orchardists who have made a careful study of the matter, consider its effect on the mechanical condition of the soil, to be of sufficient value to warrant the continuance of its use in their orchards. It seems to be regarded as an undisputed fact, that the presence of humus in the soil, makes the other fertilizers that are applied, much more readily available as plant food. It is also supposed to release some of the insoluble chemicals, that exist in most California soils. At present I am sowing one ten acre orchard to vetch, and another ten acre tract to a variety of leguminous plants, the seeds of which are furnished by the Bureau of Plant Industry on an experimental basis."

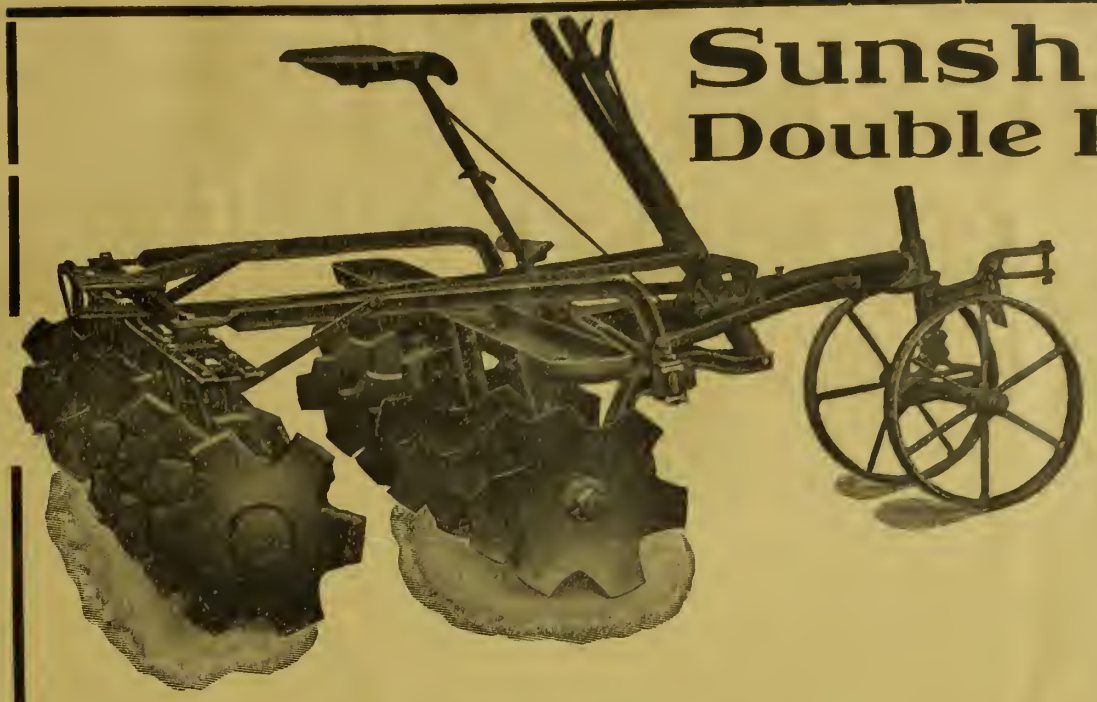
We shall be glad to hear from Mr. Thorpe if consistent with his connection with the Department, as to results of his experiments.

## KEEP OUT THE PESTS.

Speaking of the importance of keeping pests out of a fruit producing section, Prof. Cook said at the recent picnic of the San Fernando Fruit Growers Association:

In going through your groves I find very few insects or scale here, but it is a matter of considerable importance and we should give it more attention. While, of course, considerable effort has been put forth to eradicate these pests yet during the past year we have discovered the mealy bug, red and purple scale, pests we did not know we had. We ought not to have politicians controlling these affairs, but men that know their business and are alive to the importance of these conditions.

While you think your climatic conditions are such that scale cannot survive, yet I want to tell you that they do become acclimated. Take for instance Riverside. Several years ago they had no scale and thought that on account of the hot winds they would never have them, and now they have them. At any time you think you are safe, the disease may fall. Take Highlands and Redlands. They were doing just as you are now, and today are organizing to fight the scale. It is a fact that scale become acclimated, change their habits and get down into the roots of plants to seek protection. If you do not fight them, they will propagate and soon cover your groves. Another trouble is that getting on other plants, it is hard to keep them out. It is, therefore, necessary to keep them out. How much better it would have been to have kept them out of this state, than to now be spending thousands of dollars to fight them. If you are wise, you will keep them out of this valley. Have such a quarantine that these insects will not get in.



**Sunshine Double Disc Harrow**

Will thoroughly pulverize and cultivate the soil in one operation, and will leave a level surface.

The 'Sunshine' can be changed from a Double to a Single Disc Harrow in a few minutes' time.

## INJURY TO PEACH BLOSSOMS BY COLD.

THE PEACH tree is one of the most susceptible fruits to warm weather that we have. The early warm spells which are more or less common in New Mexico during January and February frequently cause the peach buds to swell considerably. If these warm spells continue the late peaches will begin to open, at this place, (In the Mesilla valley) about the first weeks in March. After the buds are open it is quite common to have a change in the weather. Occasionally during these cold spells the temperature may drop down to 25 and 22 degrees F. It is those late spring frosts which are responsible more than any other one factor for the failures of the peach crop in New Mexico and in many of the peach growing sections of the country.

The temperatures at which these peach blossoms or peach buds are injured has been given by different authorities at different degrees. W. H. Hammon in "Frosts, How and When to Prevent Injury Thereby," gives the killing temperature for the peach in the bud at 29 degrees, in bloom at 30 degrees, in setting fruit at 30 degrees. Another authority says "And while the growth of the pistil is mostly after fertilization it is, however, true that during the time when it is receptive to the pollen it is most susceptible to cold and other conditions and it is the portion of the peach bud that first manifests injury from frosts or other exposures." The temperature at which a peach blossom is killed depends on a number of conditions, the age of the tree, the stage of development of the blossom, the degree of cold, and the length of time to which the buds are exposed to the low temperature.

Observation on the injury of peach blossoms by cold were made at the experiment station peach orchard this spring. The observations were taken in a three year old peach orchard. The trees are exceptionally vigorous and they bloomed very heavily. Minimum self registering thermometers were placed in the orchard close to the peach trees. The winter of 1908-9 was quite mild. During January the exceptionally warm weather caused the peach buds to swell considerably. By the 2nd of March such varieties as the Elberta and Salway were beginning to bloom. These varieties were in full bloom by the 10th of March, when there was a snowfall of about six inches. For the next two days after the snow the temperature dropped down to 16 degrees. This low temperature killed all of the buds that were out in full bloom and those that were about to open. Again, this cold spell caused all of the varieties which were not out at this time to be retarded considerably.

It is estimated that on account of the cold spell such varieties as the Texas King, Elberta, Hyne's Surprise, and Sneed bloomed two to three weeks later. These varieties were beginning to bloom on March 24th and they were in full bloom April 5th. On March 31st the weather was quite cool and on the morning of April 1st the temperature dropped to 26 degrees. In places close to the orchard where there was a little water a thin film of ice was found. After having read the self registering thermometers in the orchard it was thought that all the fruit had been killed. In the afternoon of April 1st a thorough examination was made of the trees in bloom and it was found that there were about two per cent. of the blossoms killed by the low temperature of 26 degrees. Why this low temperature did not do any more injury is due perhaps to the fact that it did not last at that degree but an instant. Had that temperature lasted an hour or so there is no question but that a very large per cent. of the buds would have been killed. On the morning of April 8th the temperature dropped to 24 degrees. This low temperature lasted for over an hour. The result was very disastrous. In the afternoon all of the peach varieties out in bloom were examined and it was found that the injury had been very great.

From actual count it was seen that the buds which had been open for some time and which were setting fruit seemed to be more delicate than the recently opened buds or those about to open. This is contrary to the general belief and also to the opinion of some of our horticultural authorities. It was thought that the freshly opened buds were more delicate than the ones which were setting the fruit. On the morning of April 9th the minimum temperature registered in the orchard was 29 3-4 degrees. Though this temperature lasted for about ten minutes there were no injurious results from it.

While all of these observations are only preliminary, at the same time a number of interesting facts seems to have been brought out. In the first place it seems that the opened buds will not be killed by a freezing temperature of four degrees provided it does not last long; that even a temperature of 26 to 24 degrees when it lasts for over an hour will not kill all of the freshly opened buds or the buds that are about to open. The freshly opened buds seem to be more cold resistant than the older buds or those which have lost the petals. The killing temperatures as a rule take place early in the morning. From four o'clock to six o'clock is the time when the spring killing frosts are expected.—Fabian Garcia, New Mexico Ag. Exp. Sta.

## WANT AN IMPROVED PACKAGE.

The apple growers and dealers of the country are a live set of people and if there is anything in their line that will make the business an improvement over what they are now using for the purpose they want to know it. For years the only package for apples was the barrel, but as the business advanced and improved, it was found that the present box was better, and now the universal package is the box. It would almost seem that the box was as good as would ever be secured, but one never knows, and perhaps there is an idea smouldering in the brain of some individual that, if developed, would result in a revolution in the apple packing and

# Scalefoe

Greatest Known Spray or Wash for Scale: San Jose, Black, Red, Purple and Brown. Also a sure thing for Red Spider, Canker Worm, Moss, Gum Disease, Silver Mites, Mealy Bug, Caterpillars, Lice, Codling Moth, and all Insects and Bugs that infest plant life; without injury to the plants, and with positive benefit to the soil, when applied.

This has long been the leading Spray or Wash in many sections of the country, wherever introduced. We have bought the formula and the rights for this section and are putting it out under our own brand. No article can bear the "West Coast" name unless it is the best of its kind. We guarantee Scalefoe to be just as represented. Send for circular with many testimonials.

Gallon can, 85 cents; 5 gallon can, $3.75. If not sold by your dealer will send gallon can for $1 or 5 gallon can for $4, freight prepaid by us within 200 miles. Write for price in barrels. Mix 20 parts water to 1 part Scalefoe, before using; makes it the cheapest as well as the best. Satisfaction or money back.

distributing industry. To find and develop this idea the Colorado National Apple Exposition is offering a medal of honor to someone who will produce a package that will be judged to be better for marketing purposes than the present package.

### RELATION OF FRUIT GROWERS TO NURSERYMEN.

The relation between fruit growers and nurserymen should be most cordial and candid for each must depend on the other. The nurseryman could not exist without his fruit grower customers, and on the other hand few trees would be planted if each man had to propagate his own. To be successful, the nurseryman must have the confidence of the fruit grower. There have been times when the fruit grower was justified in condemning the nurseryman in strong terms because the trees were not of the grade or variety purchased and paid for. There is nothing meaner in the whole business of fruit growing than for a nurseryman to sell and agree to deliver one variety, and then without the knowledge or consent of the customer to deliver some other variety, no matter if it is done by inattention or by error. If the fruit grower wants to order Ben Davis apple trees it is the nurseryman's duty to deliver Ben Davis and nothing else. If he connot furnish Ben Davis trees it is his duty to say so and then to obtain permission before substituting some other variety. It is a satisfaction to know that reliable nurserymen are honorable in this matter and may be depended on to deal fairly.

When a fruit grower decides upon planting trees he should make out a list stating what he wants; that is, the names of varieties, the number of trees of each variety, the age and size, low headed or high headed, root grafted or budded, and submit this list to the nurseryman asking first if he can furnish the trees as specified, and second at what price. Dealing direct with the nurseryman is best, then he can be held responsible if the trees are not as represented. Nurserymen who win the confidence of, and deal fairly with, their customers, need not worry about future sales. One honest deal will be followed by many orders.

As a rule it is best to deal with the nearest reliable nurseryman, then shipments will be shorter and freight or express bills less than when dealing with distant firms.

### THINNING APPLES BY HAND.

I have had a few years' experience in thinning apples in large quantities, and I am satisfied it pays when one grows good fruit. Hired men take ladders and go over the trees and remove the imperfect and surplus fruit with the fingers. One must be careful to look at each specimen to be left, and see that it is perfect, and all that are scabby, stung, wormy or unshapely should be pulled off. The picker should place a finger and thumb on the twig to keep it from breaking off while he breaks sidewise with the other hand.

"It seems selfish, you say, to enjoy our blessings when there aren't enough to go round among all your fellow beings. Why, my dear fellow, that's the only way to make them go around."—Samuel Crothers.

## SEASONABLE SUGGESTIONS.

By Mrs. M. E. Sherman.

IN a few weeks the time for the Farmers' Institute will have come around once more. Have you thought of this important meeting before? It is of the greatest importance for every farmer to attend. Even if the University men do not know as much as the farmers, the farmers should be generous enough to come and inform them. During the summer in looking after the stock and fruit, problems come up that could not be decided off hand. Each day of the Institute these questions can be discussed by an intelligent audience and submitted to the University experts for answers. Are you prepared to get the good of this meeting? I do not mean are you prepared to go there and eat some one's new cake or new salad. I know that few think of the Farmers Intsitute as a Quiz School, yet if it was used in that way it would reach more practical results. After every Institute I attend there comes a trail of simple questions showing that had the farmer gone there at all prepared, the questions could have received intelligent discussion. The personal element of talking to an audience is far more than the mere answering of a question, they catch the spirit of investigation. Using opportunity is the way to acquire information or money. Whatever we have most at heart will come to us. We add to ourselves the thing we love, if it is only a little yellow dog. Now do not miss this opportunity. Keep a tablet of paper and a pencil at hand and jot down all the puzzles that have come up in the day's work. Write questions to cover them and bring these questions before the farmers at the next Institute. If you are too timid to talk to them directly—and it is a pity that self consciousness ever is awakened in the human mind—write out the questions and put them in the Question Box.

### Bugs.

One correspondent writes to me about a bug that has troubled the pumpkin vines. That is a uestion for Prof. Clarke and out of his wisdom will come a cure or at least a palliative for this pest. It is his every day business to meet and over come bug foes. In Fresno we have less trouble with pests that live in the soil, than in some other parts of the world. The heavy land runs together and they do not increase rapidly. The phyloxera on the roots of the grape vines, have a hard time of it, for after twenty years they have only destroyed small circles of vines in a few of the worst vineyards and even then the rate of spreading has been very slow and the improved resistant roots are in bearing before there is much loss. So I do not know much about bugs, but Prof. Clarke is intimately acquainted with them. It is only necessary for them to meet to be known to each other.

### Cheap Feed.

The alfalfa meals will have to be used more and more, yet as the price of alfalfa hay soars up they will naturally become more expensive. It is now a problem to secure something for the cows at reasonable rates. Last year Caprico meal helped us out considerably. This is a by-product made from raisin seed. We feed two pounds of it with one pound of rolled barley and one pound of bran. While this is not strictly in balance the cows have to balance it up with alfalfa hay themselves. This year we will use brewers dried grains and hope to make it answer in our mixture without using any bran at all. The bran used in the other ration is merely to please the cows, as they eat it better than without bran. One year I tried adding a little anise seed to the feed and found it helped the cows to eat it up clean. The cow's taste has to be consulted if the milk pail is to show results.

### Figuring.

The question was asked me today by phone, and now comes in a letter, how butter fat is figured out. Now the 4 per cent means that in every hundred pounds there are four pounds of butter fat. The cow we are testing has produced 28 pounds of milk. How much butter will she produce in one day? Multiplying 28 by .04 gives 1.12 of butter fat in a day. Now butter fat is only 80 to 84 per cent of commercial butter, as water, milk and curd is found in butter. The salt in butter is carried by the water surrounding each tiny globule of butter fat. To add one sixth of the amount of butter fat will show the amount of butter produced. Divide the 1.12 by 6 and add the result to 1.12 pounds and this will give the total amount of butter for one day. Many creameries pay the quotation price of butter for the fat, the overrun of butter being enough to pay for the cost of making and selling the butter. The overrun of butter has been made excessive in many cases—by using water filling. By adding warm water in the washing a large amount may be incorporated into the body of the butter. Twenty-five per cent has been added in this way. The Government prosecutes all cases where more than 15 per cent of water is carried by butter. One creamery in San Jose has recently had to pay a heavy fine for adding too much water to the weight of the butter.

### Milker's Day.

A question is often asked as to what is a milker's days work. Thirty cows milked twice a day is considered a man's work. If the cows are milked three times a day, then two cows count as three in a string. The work begins at different hours on dairy farms, governed by the hours at which the milk or cream has to be shipped out. At this home ranch Alex goes to work at 3:30 in the morning, putting the cows into the barn from the corrals or field where they are ready for milking. He milks

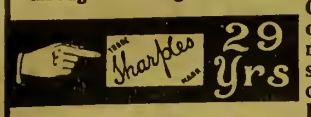
# Good Reason

Users have good reason to consider Sharples Dairy Tubular Cream Separators the World's Best:

**ETHELTON, Aug. 29, '09. "I bought a disk-filled cream separator. It worked fairly well for two years, then started to run hard, getting worse, until I could scarcely turn the milk from six cows through. It got skimming poorly. Could see cream on milk after standing overnight. Finally got so disgusted with it that I bought a Sharples Tubular. Would sooner pay for a Sharples Tubular than use a disk machine for nothing. Could turn my Tubular all day if necessary. Can wash it in quarter the time, skim cleaner, make heavier cream. My cream test now is 50. Tubular bowl hangs from ball bearing and never gets out of balance."**

**—Joseph Walker.**



Tubulars are replacing all other makes. Different from all others. The only modern separator. World's biggest separator factory—branch factories in Canada and Germany. Sales exceed most, if not all, others combined. Write for catalog No. 260.

**THE SHARPLES SEPARATOR CO.**
WEST CHESTER, PA.
Chicago, Ill., San Francisco, Cal., Portland, Ore.
Toronto, Can., Winnipeg, Can.

them, putting the cans on the milk truck, feeds the calves needing new milk, and then puts the cows out into the field before the breakfast bell rings. After breakfast he hitches Sam to the milk truck and hauls the new milk to the separator, puts the separator together, and the engineer turns on the steam. They then hoist up the milk to the tank and turn it into the separator. Alex tends the separator, taking away the skim milk cans as fast as they are filled and standing them on the truck. After the morning milk is through, the milk from the night before is turned into the tank and the steam hose turned into it to warm it up to blood heat and melt the clotted cream. This is then run through the separator. The two lots are kept separate so that the creamery may sell the cream from the morning milk for cream, while that from the night milk is used as butter cream. The two lots of skim milk are also kept separate, as the morning milk is used to feed the younger calves and the tiny pigs, while the skim milk from the night before goes to the older calves and hogs.

Alex hauls the milk down to the younger stock and turns over the milk to the roustabout who feeds the older pigs and calves. Alex then comes back to the creamery with the empty cans, washes and scalds them and the separator and the milk tanks, loads up the clean cans for the evening milking and puts them on the racks at the barn. Sam is then unhitched and Alex goes to bed to sleep until the noon bell wakes him.

After dinner he puts on his dirty clothes, cleans out the stables and sprinkles them with gypsum, then does his washing, cleaning up his suit worn at the morning milking, and scours himself up with hot water in the bathroom. After that, dressed in his clean clothes, he opens the gate and stands and calls the cows, they rise up and slowly trail in after him to the barn and in at the doors. As fast as they come in he drops the chains behind them in their stalls, takes a wide brush and puts any manure out of the way into the gutters, covering it with gyysum, then goes over the cows' udders carefully and sees that they are clean, puts on his clean milking jacket and overalls, washes his hands and arms and goes to milking at three o'clock. After the calves are fed on the new milk he goes out with the cows to the field again, then back to harness Sam and haul the milk up to the water cooler where it is placed under a screened house in the open running ditch water to remain until morning. He then goes back to the barns, cleans and throws out the droppings for the morning, to be hauled off by the roustabout, sprinkles gypsum on the floors, and as the supper bell is ringing, turns old Sam out to eat with his friends the cows, and goes in to eat the food that is sweetened by a day of faithful toil.

### Cleaning.

The roustabout hauls all the manure away each day from the horse, cow and other barns and feeds the pigs and looks after the outside stock. The dry cows and springing heifers are with the milk cows at all times, as Alex looks after them more carefully than any one else. The heifers are made gentle by coming into the yard with the cows and often come into the barn in the winter time and receive a small grain feed with them. The outside silage racks are filled by the roustabout and he does everything else not mentioned as Alex's work. My faithful Alex has been here off an on for seventeen years and when I do not have him, I have one of his nephews or brothers or cousins, and they are faithful, good men. I have had in former days as many as seven of these Moors at one time as milkers, and they are good when handled with precision. They do not like meddling by foremen, but prefer to receive orders directly from the boss, which they carry out to the letter every time. There I have knocked on the desk three times so as not to spoil the luck.—M. E. Sherman.

---

Untimely severe frosts sometimes damage the corn crop so that its marketable value is considerably lowered, but in this event, as in other cases, the hog comes to the rescue. Soft corn is considered excellent for swine, and especially for the young; in fact, many breeders believe they can obtain better gains from soft corn than with the sound, hard grain. In soft corn the maturing of the grain has been checked, thereby arresting the development of the starch content or fat-producing element. When used it is advisable to add, for finishing, some corn that is well matured Immature corn that is frozen and even somewhat soured may be fed to hogs, but if there is on hand a greater quantity in that condition than can be used on the farm before warm weather sets in it should be disposed of while the weather is cold. Ordinarily it may be used in cold weather without danger, but it should not be carried over into the warm season, as it will ferment and become unfit for use.—From Coburn's "Swine in America."

# Bees and Their Care

## "CAN BEES MAKE BAD HONEY?"

By Henry E. Horn, Riverside.

UNDER the above caption the "California Fruit Grower" of August 21st, 1909, reprints an article originally contributed to the "Retailers Journal" by H. G. Hertel, wherein the latter attempts to dissipate supposed popular fallacies concerning honey making in particular, and apiarian practices in general. Mr. Hertel's efforts can scarcely be called a success, and that for very simple reasons. His knowlege of the matter in hand is plainly book knowledge, and conglomerate book knowledge at that, and though the latter is often very useful, and even necessary, still it alone can never fully equip a critic.

Mr Hertel's category of bee-ological errors opens naturally enough with the honey bee "him" self which he speaks of as "he," whereas everybody who ever kept even only a single colony knows that the he bee and the insect universally known as "the" bee are two very different institutions. The last, the nectar gatherers exclusively, also called workers," are a species of "she's," if anything, certainly not "he's," for at queenless times they sometimes undertake to lay eggs, a female accomplishment exclusively. Their physiological status is not as yet as clearly determined as it might be wished, but "he's" they are not. The males, or drones, of the bee hive, Mr. Hertel, work not, neither do they spin. Their mere presence is sufficient compensation for their board and lodging to the rest when times are good in this ideal "suffragette's" state. But when provisions run low—this is the night side of the thing—drones are murdered off and their mutilated corpses thrown out of doors like so much rubbish. This has been the law in the beehive since Tertiary times, a little matter of ten million years, or so.

Extracted honey is spoken of as cleaner than "strained," because the latter is supposed to be the resultant product of pressing honey, brood, pollen and all the contents of a comb into some vessel, and then straining the honey out in some way or other, whereas extracting is said to throw the honey out, only, leaving the brood in the comb. If Mr. Hertel will continue his apicultural studies there is hope that eventually he will catch up with the facts of the case.

The bee hive of a modern apiary run for extracted honey—and from such only the whole mass of the honey in the market comes, practically—consists of two distinct and separate apartments—to-wit: the broodnest; the box standing immediately upon the bottom board, containing all the brood and pollen and some honey; and the super or honey chamber. Between those two a perforated sheet of zinc is placed for the purpose of excluding the queen from the honey chamber, and, hence, also all brood, yet not the workers; the size of the perforations governs this point to a nicety. There is then no brood, larvae, pupae, or anything else in the super, but honey only; clean, white, aromatic slabs of the size of the frames used. To him who knows, nothing in the line of preserved food stuffs could be cleaner than honey as it comes from the apiary.

### Honey Dew.

As regards honey dews; sometimes for some unknown reasons pine boughs sweat out a clear sweet liquid; this liquid bees of the neighborhood will gather and deposit in their combs. But as for that stuff being unclean, or unhealthy, why, the healing virtue of the pine woods itself is concentrated within it. In the Black Forest region of Germany pine honey, of which some is secured every season, is used as a folk remedy for throat and lung troubles.

Farther on aphis excretions, or secretions, are claimed as sources of "bad" honey. Here, also, Mr. Hertel seems to have mislaid his facts, for in an additional statement he speaks of ants "herding" aphidae for the sake of their sweetish offal. Now, ants, that will nigh omniscient nuisance, do herd a certain insect sure enough, or rather, tickle it until a handout of sweets is shoved out to them, but that insect is no aphis, but a certain kind of scale; nor is the miserable little green humpback on our rosebushes and melon rinds anyway related to it.

What a perversity it seems, anyway, to list aphis excretia (if such it really is, which is not so very sure) among the sources of bees' honey. And what a lack of understanding of the interior economy of the bee hive it discovers.

Even granting that bees could scrape up a mite of the sticky shining stuff on oak leaves and elsewhere, they certainly never bother with it as long as nectar sources flow. And it so happens that as soon as the latter dry up—that is to say, as soon as supplies cease to come in freely, whatever may still be gathered never enters the supers, but is deposited directly in the broodnest for immediate consumption by the bees themselves. Aphidae honey is about as plentiful in the market as icicles on the eaves in July.

Mr. Hertel finds fault, also, with Dr. Wiley's regulations relative to comb honey, which, he thinks, bear the inference that all comb honey is pure. And then the gentleman proceeds with a good deal less reason than Wiley's to instill the contrary inference by illustrating how easy it is to feed bees cheap glucose with which to fill their combs; thus producing adulterated honey sure enough which yet wears the mask of purity on every inch of its face. Where the necessary but impossible combs are to come from constitutes the lapse of Mr. Hertel in this instance.

Finally, "honey is essentially saccharine syrup" retailers are assured, which is precisely like saying that the flowing stuff of noted mineral springs is essentially wet water.

If a vial of honey is wrapped up in contact with a sensitive plate for a week or two the latter will upon development bear the image of the former. Mineral waters will produce the same result. The phenomenon of course, indicates that both are radium bearing. It is now held that the power of the springs to heal and comfort is one with their radio-activity. The presence, therefor, of that same native of the borderland of infinity in honey, as sharply differentiates between it and "saccharine syrup" as it differentiates mineral from river water.

**Feijoa Sellowiana** A most delicious fruit that can be used for every purpose that an apple is used. Strong plants 75c.

**Pleroma Splendens** with foliage of velvet and royal purple flowers, 75c.

**Avocado or Alligator Pear** Seedlings and budded trees. Many novelties in plants.
**COOLIDGE'S, Pasadena, Cal.**

# The Ornamental Garden

## PLANTS THAT BECOME PESTS IN HAWAII.

THE Territory of Hawaii is compelled to watch the importation of plants and vegetables probably more closely than any state or territory on the mainland, in order to guard against the entrance of pests both of the animal and vegetable types. For the past five years the quarantine maintained by the Territorial Board of Agriculture and Forestry has been very strict and though onerous at times, is very generally supported by public opinion. Many insects and plants which in their native habitat are so controlled by either their natural enemies or by the period of cold weather, that they do not in any sense constitute pests, become very troublesome when brought into a salubrious climate such as Hawaii possesses; and hence great care must be exercised in allowing any new thing to be brought in.

A very striking example in this regard is to be found in the lantana plant (L. Camara—of the verbenaceae group) which is valued all through the United States as a bedding-out or green-house plant, and which is rather difficult to raise north of the Gulf states. Some plant fancier brought the seed of this shrub into the islands some years ago, and now it constittues a thoroughly defined and very troublesome pest. It has obtained a foothold on most of the islands, and has taken possession of large tracts of pasture land, and other uncultivated tracts, where it forms almost impenetrable thickets. Laws have been passed to check its spread, and an insect enemy imported which it was thought would destroy it. This has been of some efficiency, but there is now some uneasiness lest the "lantana blight," as it is called, will refuse to confine its attentions to lantana alone.

On some of the islands cattle men have much trouble with the common North American blackberry and raspberry which here refuse to confine themselves to fence corners and out of the way places, but sometimes take possession of considerable areas of pasture lands. Considerable money has been spent in employing laborers to dig out the roots from the cattle ranges.

The well known Bermuda grass of the south, while furnishing a valuable pasture for stock, causes the sugar planter considerable trouble in Hawaii; while the bugbear of the cotton states, the Johnson grass, is also present here, but does not seem to cause the trouble that it does in some parts of the mainland.—Will J. Cooper.

## YARD AND GARDEN.

If your lawn is larger than you can care for properly, plan now to have it of suitable size by filling in with hardy, thrifty growers that will take care of themselves.

Don't neglect to drop a few seeds of perennials in the bare places this month for bloomers next year. Seedlings cost but little, while plants are expensive. Many beautiful things can be raised from a package of mixed seeds of perennials.

Now is a good time to plan changes in the border and the flower garden, and do not make the same mistake this year and plant the tall growers in front of the low ones; in grouping ill-matched plants and mixing in harmonious colors keep a notebook and pencil in hand.

In arranging the home lot, whether for fruit, shade or ornament, plant the tallest growers well to the rear, grading down to the lowest or creeping things, letting the rows run east to west, that all may have the sunshine. They can thus be seen to the best advantage and prove a joy forever.

Don't buy spongy, soft bulbs if you want good results. The bulbs worth having are solid and heavy. Heavy Dutch bulbs of the single variety make fine plants and give fine spikes of flowers, but many prefer the double-flowered ones for the house. Insist on having good, fresh stock. Send your order early.

## THE HOME FLOWER-PLOT.

If the flower garden crops are not making due progress stimulate them with nitrate of soda. A teaspoonful worked into the soil about a dahlia is about the correct proportion.

Don't get into the habit of sprinkling the surface of the ground, but when your plants need water, apply it generously, or not at all. Water after sunset if possible.

Farm land destroyed by gullies and sandbars from freshet. The farm was abandoned in consequence.

**Burr Clover** The best cover crop. We can offer it at a reasonable figure. Write to us for prices on this and other green manuring crops.

**Get Our Prices on New Crop ALFALFA SEED.**

**Onion** White Bermuda, Red Bermuda, Crystal Wax, New Queen. Now is the time to plant early onions in the Great Inland Valleys of Southern California. And we would especially call your attention to our line of imported onion seed. They are all True to Name and "Full of Life." Get our prices on large quantities.

**Sweet Peas** Plant the early varieties now for flowers this fall. The following varieties bloom in 50 to 60 days from planting. 10c per packet, 3 packets for 25c. ***Morris & Snow's Earliest Pure White*** (Gould). ***Earliest of All,*** pink and white, very early. ***Bodger's Earliest Pink,*** New. Proved a great success last year. As early as the Earliest Pure White. (We control this stock.) ***Mount Blanc,*** pure white.

**Send for Our Catalogue**

**MORRIS & SNOW SEED CO.** 425 So. Main Street Los Angeles, Cal.

**Eucalyptus Trees for Fall Planting**

It has been demonstrated in the San Joaquin Valley that the best time to plant Eucalyptus trees is about the first of November, or as soon as the rains have thoroughly soaked the soil.

We have 200,000 trees of various varieties just the proper size for fall planting. We would advise that you place your order early, as there are very few trees to be had at this time of the year.

## "Eucalyptus Facts."

SOMETHING over a year ago a native Australian appeared in the office of the Cultivator pretending to have a great range of information regarding the eucalypts as they are grown in their native country, and suggested that California was missing a great opportunity in not giving more attention to the growing of the Jarrah, or Eucalyptus Marginata. As it happened we had but a short time previous been seeking information as to the habits of this tree when brought from Australia to this country and had found that in Australia it was a wonderful tree in many respects and produced a wood which had extended uses, but in California no trees had yet been found that had survived more than two or three years. Therefore at the time, the information of our Australian friend was not received in this office with the enthusiasm which he anticipated.

Later, this gentleman returned to his native land and brought to this country large numbers of eucalyptus seeds of all varieties possible. It is probable that in this collection of seeds there may be some which will be of great value. Becoming connected with certain interests which were boosting eucalyptus culture beyond all reason, a supply of "hot air" was supplied daily papers proclaiming the wonderful possibilities of eucalyptus culture. The amount of rot with which these papers have been deluged is astonishing, and has finally stirred up protests from a number, especially the Los Angeles Florists' and Nurserymen's Association against what they claim is a simon pure fake. As one proof of the preposterous claims being made, the Association, in a printed circular issued to endeavor to correct the wrong impressions created by this advertising, quotes a Los Angeles morning paper from an article which points out the great wealth to the city and county of Los Angeles which will accrue from the planting of eucalyptus trees along the right of way of the aqueduct which will conduct water from Inyo county. The article says:

"Within ten years these 25,000,000 trees can be cut at a profit of $100,000,000, which will wipe out the entire cost of the aqueduct and put $75,000,000 in the city treasury besides. This surplus would relieve both Los Angeles city and county from all need of taxation for ten years. Before that time another cutting would yield another $100,000,000, and so on, which means that these trees would lift the burden from both city and county indefinitely."

Such silly statements should have been stopped, but unfortunately they have been published, and unthinking people with little knowledge of growing things have jumped too quickly at conclusions.

The eucalyptus has a wonderful future in California. People are today astounded at the wealth created by this tree, and it is only just to it and to ourselves that we look at it with some degree of reason and not spoil its future by giving currency to such claims.

The report of the society is signed by Messrs. E. Braunton, Chas. Winsel, O. M. Morris, Jacob Dieterich, Theo. Payne, and T. P. Lukens.

## Discouraging

THE lima bean growers are being given quite a thorough disciplining by the big buyers and shippers. So far the bean people are standing pat and giving promise of remaining true to their own best interests, but it must be admitted that they will face a discouraging proposition in attempting to handle the output of their fields so as to secure for themselves a living price. The bean buyers are hammering at the market, and in every way endeavoring to make it so unpleasant for the producers that they will throw up the sponge and follow the same old way of turning over their product to the buyer that he may make his usual big profit from it.

Their habit in the past has been to bear the market by showing all the discouraging features in the early part of the season when they were buying, and then when the full percentage of the crop has been bought, the eastern buyer gets the bull side of the question, and prices are boosted to the utmost possible limit. As a result, the low price to producer and the high price to consumer has discouraged both ends. The bean growers association wishes to correct that if possible, and asserts that it will show the eastern buyer that it can protect the trade, for it has sufficient quantity of the crop in hand to do this. We wish all kinds of success to the association, and hope it will win out in face of the strong opposition.

## An Important Work.

IN A recent issue of the Cultivator reference was made to a meeting of fruit growers of the Sacramento Valley at Newcastle, at which an effort was made to put the fruit growing industry upon a firmer basis by inspiring growers and packers to make a more uniform and attractive pack, and by arousing them to demand of the county supervisors the fulfillment of the law in the appointment of a county horticultural commissioner to advance the industry more than has been done in the past. This Newcastle meeting has apparently created considerable interest, for we note that State Horticultural Commissioner Jeffrey has conducted another such meeting at Loomis this week, and others are planned for Placerville and Lodi later. These meetings will doubtless direct attention to the coming State Fruit Growers Convention to be held at Watsonville where many of the same questions will be discussed. This is a valuable work, and we trust that our state commission will push it in the fruit growing communities.

## Garden Work in California Schools.

THE University of California has issued Circular No. 46 which is filled with suggestions for garden work in California schools. It is written by Prof. E. B. Babcock, and is filled with a number of illustrations which give force to the text. As Mr. Babcock says, "The school garden has come to stay. It is not a fad; it is a fundamental prerequisite to all true nature study, and the value and place of true nature study is now firmly established. School gardens teach among other things private care for public property, economy, honesty, application, concentration, justice, the dignity of labor, and love for the beauties of nature."

Besides containing direct information the circular gives methods of teaching, and closes with a list of books and pointers for teachers showing where to secure further information along this line.

## Mis-Branding Fruits.

THE FOOD AND DRUG ACT is bringing many short weight packages to light as well as causing less adulteration and less use of poisonous preservatives. A circular recently received from the board of food and drug inspection gives numerous cases where California fruits labeled two and a half pounds have been found to contain 34 ounces, including weight of can. "Two pound" cans of string beans packed by an eastern concern were also found to show a gross weight of only 22 ounces. Heavy fines in these cases will probably result in bringing up the packages to full weight or correcting the statements on the labels.

## National Apple Day.

OCTOBER 19TH should receive more attention from fruit growers of the country than it has in the past. It has been designated as the national apple day, and our apple growers at least should see to it that more publicity is given to this day and the attention of the people directed toward giving this luscious fruit a larger share in our diet.

THE THIRD BIENNIAL REPORT of State Horticultural Commissioner Jeffrey is just issued. It not only contains the biennial report and a review of the fruit season, and much information as to quarantine subjects, the white fly campaign, demonstration train service, and other features of the commissioner's work, but in addition has the full proceedings of the Thirty-fifth Convention of Fruit Growers held in Sacramento last December. We doubt not this report will be sent to all fruit growers who may apply to the commission at Sacramento.

THE TWELFTH SEMI-ANNUAL MEETING of the Counties Committee of the California Promotion Committee will be held at Visalia November 13th. This meeting will give particular attention to horticulture in California. This we suppose will be purely from the commercial standpoint, but will doubtless have some interest for producers.

THE CONDITION OF APPLES on October 1st is represented by 43.9 as against 44.5 on the first of September and 54.1 ten years average for same date. This shows that apple conditions this year are materially off. So far as the Pacific Coast is concerned, we believe we will be benefited by these conditions which more largely affect the Eastern growers.

CORN showed a material shrinkage in condition from the first of September to the first of October and is now somewhat lower than the ten years average. There will, however, be a good crop taking the country over. The corn of the country is all produced in twenty states, and California is not on the list.

IT IS SAID that of the seventeen Jersey cows in the world which have produced more than 700 pounds of butter per year, five, or nearly one-third, were bred and developed on one agricultural college farm, that of the state of Missouri. An agricultural college on such advanced ground is worthy of imitation.

# Agricultural News Notes of the Pacific Coast

## Northern California

Petaluma has over one million laying hens.

The town of Orland is contemplating incorporation.

Anderson, Shasta county, will have a prune output of 2000 dried tons.

Nevada county stock men are experimenting with spineless cactus.

Walnuts at Mantone, Tehama county, gave profitable returns this year.

The Petaluma Incubator Co. secured the grand prize for its incubators at the A-Y-P Exposition.

As a general thing the crop reports of Chico are very favorable and producers have made good money this year.

Farmers near Los Molinos, Tehama county, are extending their irrigation system so as to cover 1200 more acres of territory.

A Woodland sugar beet grower has proved conclusively that irrigation has been most profitable to the growing of beets.

Surveyors are now at work on a drainage proposition by which 20,000 acres of fine land near Bieber, Lassen county, will be drained.

Two separate irrigation enterprises are contemplated near Marysville, Yuba county. They will together cover over 20,000 acres of land.

A Woodland vineyardist reports that he fed his grapes to his hogs instead of delivering to the winery trust and received double the price which the winery people offered.

Petaluma received for its shipments of poultry and eggs the sum of $5,798 every day in the year. The total receipts for 1908 were $2,116,604, of which $1,726,601 was for eggs.

The Poultryman's Protective Association held a meeting last Saturday at Petaluma and an effort was started to secure a greater membership among the poultry people of Sonoma county.

Insurance Commissioner Wolf has ordered the California Mutual Livestock Insurance Company to cease doing business in this state. The commissioner has taken charge of the books of the company.

The Examiners for County Horticultural Commissioners hold examinatons at Auburn, Placer county, Nov. 10th, Nevada City, Nov. 12th; Oroville, Nov. 16th; Yuba City, Nov. 17th; Marysville, Nov. 17th.

A heavy rain covered much of the Sacramento Valley on October 1st. Raisins and prunes were injured in many cases. Table grapes on the vines were seriously injured by the heavy rains of the first of the month.

The officers elected at the recent meeting of the State Grange Patrons of Husbandry are as follows: Master, E. P. Pettit, San Jose; Overseer, F. H. Stiles, Tulare; lecturer, F. H. Babcock, San Jose; steward, W. E. Stewart, Danville; assistant steward, Geo. Schymeyer, Elk Grove; chaplain, Mrs. Caroline Emery, Oakland; treasurer, Joseph Holmes, Sacramento; secretary, Emily Burnham, Healdsburg; gate keeper, Cornelius Van Keppel, Santa Rosa.

## Central California

The almond crop of California this year will be about 1200 tons.

A Turlock farmer has found broom corn more profitable than sweet potatoes or fruit.

The farmers union has packing houses which are handling the prunes at Campbell, Saratoga and Gilroy.

It is now estimated that the shipments of apples from the Pajaro Valley will aggregate over 3000 carloads.

Pajaro Valley has already shipped over 1100 cars of apples to Eastern points. Some 35 to 40 acres are shipped daily.

It is anounced that a company has leased 200 acres of land in Fresno county which will be set out to tobacco plants next year.

Porterville has just received its first spraying outfit. In the past it has not been necessary in that section to spray orange trees.

Seventeen representatives of the various forest reserves of California are taking instruction in forestry at the California Hot Springs.

The Spreckels Sugar Co. reports that next year it will pay freight on beets shipped to its factory. It is estimated that this will increase the acreage at least fifty per cent.

The million dollar corporation proposed by a Fresno man has finally taken definite shape, at least to the extent of first steps in its formation.

Raisin growers belonging to the old defunct Raisin Growers Association have been paid another ten per cent in the final cleaning up of the old accounts.

The movement which has started in the hope of getting the Santa Clara Valley prune growers together seems to have failed so far as this year's crop is concerned.

The Delano Water Co., has been organized and is preparing to put in a large plant for furnishing water to Delano, Kern County, and for irrigation near the town.

With grapes almost as cheap as hay, the Central California raisin growers feel that they have just cause for strenuous objections to the present marketing situation.

The state board appointed for the purpose of examing applicants for the position of county horticultural commissioner will hold examinations at Visalia, Nov. 23; Fresno, Nov. 25th.

Failure of crops in many eastern fruit growing sections has resulted in a strong demand for California canned fruit, so that prices for canned goods are now exceptionally good.

It now looks as if the entire Newtown pippin and bellefleur crop of the Pajaro Valley will be picked up by Eastern buyers who have been more anxious for Watsonville fruit than ever in the past.

United States Livestock Inspector Hart and County Veterinarian Petersen of Tulare county have just finished an inspection of the stock of that county, and report them practically free from Texas fever ticks.

## Southern California

One lima bean warehouse at Saticoy recently received 1,800 sacks of beans in one day.

Broom corn in Imperial county is looking exceptionally well and a heavy yield is promised.

The Imperial county farmers union has arrived at the position where it is looking for a business manager.

Imperial Valley producers have been making a strong effort to secure more reasonable freight rates.

Hundreds of acres of pasturage were burned over in the Puente Hills back of Whittier, Los Angeles county.

Imperial Valley hopes to have several tons of Arabian alfalfa seed to distribute in that valley the coming season.

Orange county's chili pepper crop is reported to be short over fifty per cent. Last year's production was so great that prices were very low.

The walnut growers are bleaching their nuts this year by the use of the electric salt solution, most packers preferring the spray to the dipping method.

The Huntington Beach section which heretofore has been a large sugar beet field, will give up much of its acreage next year to the production of lima beans.

The manager of the Golden Orange Association at Redlands recently returned from a trip to the eastern markets, reports a promise for a good year for oranges.

The Richland Walnut Association at Orange now has machinery capable of turning out 30,000 pounds of walnuts daily, which is equivalent to about a sack a minute.

Orange county chili pepper growers expect to receive about twice as much for their output this year as last. Hopes are entertained for fifteen cents per pound.

A forest fire said to have been started by a young man in the Cleveland National Forest caused great damage and fifty dollars was imposed as a fine for carelessness.

The situation in the walnut industry seems to be very favorable and the price of 11½ cents fixed by the association will doubtless be exceeded by some sales outside.

A large reservoir in Mill Creek Canyon, San Bernardino county, belonging to the Edison Power Co. has shifted its position more than twelve inches and its repair will cost thousands of dollars.

The directors of the lima bean association have succeeded in holding the market together and even in advancing the selling price. It is claimed this is due to the agreement not to sell for less than $3.75.

The Imperial Valley has been greatly concerned over false reports which have been published in the San Francisco Call. The Valley papers now report that the Call has said that it "rejoices to learn that the Valley is in no danger of going dry and regrets that information of a contrary character has been given."

## The Coast

There are 150,000 milch cows in Oregon.

Sweet potatoes are selling at $2.50 per hundred in Seattle.

Troy, Idaho, will ship about 50 cars of apples this season.

Lincoln county, Washington, held a good county fair last week.

Three thousand Polish families will establish a colony in Montana.

A sixty foot dam at Weiser, Idaho, will irrigate 20,000 acres of land.

The Washington Agricultural College at Pullman has a class in forestry.

Elberton, Washington, will ship about 25 cars of cured prunes this fall.

A Lewiston, Idaho, melon grower cleared $1,000 from two acres of watermelons.

Over 100,000 sacks of wheat are stacked in one pile at Waterville, Washington.

A farmer at Tekoa, Washington, recently delivered five tons of oats at one load.

Pullman, Washington, will produce only about half of its usual apple crop this year.

A Douglas county, Washington, onion grower has raised an onion weighing 17¼ ounces.

Water will be taken from the River near Gooding, Idaho, to irrigate 500,000 acres of Idaho land.

The first entry for the apple show at Spokane was made by a fruit grower of Green Bluffs, Spokane county.

The state of Washington produces 50,000,000 bushels of cereals, of which about 35,000,000 bushels are wheat.

Railroads have promised concessions to excursionists to the National Apple Show at Spokane, Nov. 15 to 20.

Farmers near Wenatchee, Wash., contemplate a pumping proposition by which 10,000 acres of land will be irrigated.

The poultry exhibit at the county fair at Colfax, Washington, held last week, was better than usual, 250 fowls being shown.

Crops to the value of $3,000,000 were produced this year on lands which were under the Sunnyside Canal near North Yakima, Wash.

The forest service has installed a number of coyote proof fences in the national forest in Oregon to protect sheep which are pastured there.

It is rumored that the Secretary of the Interior contemplates a vast irrigation system on the Pyramid Lake Indian reservation near Reno, Nevada.

The display of livestock at the A-Y-P Exposition is reported to have been exceptional in every sense, and much praise is given to Prof. W. L. Carlyle for his cattle judging.

The Alaska wheat fake which was advertised so largely through the promoters working the newspapers last year, has been denied the use of the mails by the postoffice department.

# Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***

***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

# White Leghorns

**A Standard Strain of Great Layers**

With our Standard Strain as a foundation and with the ideal conditions that exist at the Model Poultry Farm we have produced a flock of birds this season that for beauty and utility can not be surpassed.

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### BLACKHEAD AND WHITE DIARRHOEA.

WE HAVE reason to believe that these diseases are becoming increasingly prevalent in the west. Our correspondence shows that they have worked their destructive course through many poultry yards this season and no doubt will appear again next season, unless precautions are taken to prevent them.

Blackhead in turkeys and white diarrhoea in chickens come from the same organism. Of this there is now little doubt. This organism is a member of the family Coccidium and it has been settled as being almost certain that it is the cause of both these diseases. Two or three years ago the Rhode Island experiment station announced the belief that blackhead in turkeys came through infection from domestic fowls (chickens), which were then thought to be immune from the disease, except, perhaps, in rare cases. German investigators, and biologists in this country, later concluded that chickens were infected with the same germ that appeared in black head, but the manifestation appeared in the form of white diarrhoea in chickens. Probably the diseases are caused by different stages of the growth of the deadly germs.

Professor Bradley, of Rhode Island, writes us that no remedy has been found, but having discovered the cause he seems hopeful of being able to find the cure.

All we now can do is to use preventive measures and the time to begin is now, so as to be protected next spring.

The thing to do is to use extra precautions to prevent the existence of the germs through the winter. The free use of disinfectants all around the poultry houses, absolute cleanliness and the regular use of epsom salts will do much to keep the flocks safe. We have great faith in epsom salts in caring for poultry of all kinds. It is a laxative and it also keeps the coating of the stomach and intestines free from the mucus which forms an ideal breeding place for germs. We learned to use this from English breeders and we believe its regular use in this country would result in great benefit.

The best way to administer it is by giving it in a mash. For regular use dissolve the salts in a little water and use this water in mixing a mash of middlings, cornmeal or any other ground feed. Do not make enough of the mash for a full feed so as to be sure all of it will be quickly eaten. The dose is a teasponful for ten old fowls or twenty young ones, proportioning the dose between these extremes according to the age. If a little too much is given no harm will result as the salts are not poisonous, except in very large doses. For half grown turkeys the dose would be the same as for full grown hens. For old turkeys up to a quarter of a teaspoonful may be used. Give the fowls a dose of this once a week. Use disinfectants about the poultry house. Sprinkle air slacked lime about the floors and the poultry yard and use every means to keep the fowls healthy and vigorous. Constant attention along this line will do much to keep away all diseases.—Poultry.

### TURKEY RAISING IS PROFITABLE

When we consider the good prices obtained for turkeys at the holiday season it is surprising that more farmers do not raise them, says the Wisconsin Agriculturist. Many do not keep turkeys because of their inclination to wander from home and perhaps because of their determination to live upon their neighbor's bounteous crops. To wander is one of the instincts of the wild bird from which the domestic turkey is descended, which has not been bred out of the time fowl. Turkeys that are real turkeys will always wander. If they are managed properly there will not be such a tendency to wander. If they are fed regularly at regular places around the barns and other buildings they will not get away so far that they cannot return in time for the regular meal. Turkeys love insect life, and when this is abundant they enjoy the woods and meadows.

As a rule turkeys do little harm to growing grain; in fact by picking the insect life they destroy the enemies of plant life, unless the flock of turkeys is so large that the grain is trampled down or the green shoots are eaten by them. Turkeys keep in much better health when they are permitted to wander over the fields, woods and highways, and they pick up a very large portion of their food. They do not do well in confinement. Their nature is wild and they must have freedom.

Turkeys are probably the choicest fowls that can be taken to market, and bring the highest price. Of all fowls perhaps the turkey requires the most care and attention during the first few weeks following incubation. But they are not "hard to raise" if you once learn the secret. The young birds are delicate, and very susceptible to changing weather conditions. They must be protected. Rainy or foggy weather is especially fatal to them.

Lice and overfeeding kill more young turkeys than all other causes combined. They are susceptible to liver trouble, or, in other words, if overfed, too much work is thrown upon the liver, which results in a diseased condition of that organ. If you are losing turkeys, hold a post mortem examination of their bodies, and in nine cases out of ten you will find the liver blotched in appearance and covered with yellow spots. We know of some turkey raisers who use calomel tablets, which give them relief if used in time. This condition of the liver is nothing more than what is termed "blackhead" in older birds.

Feed the little poults often and only a little at a time. See to it that they are always protected from the cold and rain. A young turkey is instinctively an ignorant thing, rushes headlong into danger, and seldom knows enough to get clear of an approaching storm or to come in when it

"Let the Hen Do the Work"

Coulson's
EGG FOOD

At this time of year the hens are apt to begin falling off in their laying, and it is necessary for poultrymen to keep them up as long as possible. If they stop laying too early and start molting, they are likely either to take a long time over the molt, or if they molt quickly to have another molt in the late fall.

A scientifically prepared Poultry Food like COULSON'S EGG FOOD, fed at this time will help greatly to keep the hens laying up to and well into their molting time, with consequent satisfactory profit to their owners.

Remember that all egg foods are by no means alike, and it is advisable for you to buy a brand that has stood the test of time.

COULSON'S EGG FOOD is therefore what you want to give you RESULTS, and keep your flock in healthy condition for the molt.

For sale by dealers everywhere. Write for our free book "Poultry Feeding for Profit" with samples of our Poultry Food.

rains. Always keep them well supplied with grit and water. The first week or two feed bread crumbs that have been slightly moistened in water or milk. Then gradually work cottage cheese into the bill of fare. Turkeys are seed-eaters and bug-eaters. As they grow older let the mother bird run with them through the grass so they may learn where the best feeding grounds are. As the summer season progresses induce them to come home to roost by scattering some tempting grain around the farm buildings at night. No other fowls will forage as well as turkeys through the summer and autumn and transform insects and weed seeds into the most tender and best-flavored flesh. Many people think that a turkey will eat more than a hog and is therefore unprofitable. This is not true. During the summer they pick their own food. The cost of raising a turkey is less than that of raising a chicken, and a turkey weighs more and sells for more per pound.

## POULTRY QUERIES.

### Melon Seeds Harmful.

Having read your reply in last week's Cultivator to query as to feeding melon seeds. and having had some experience in that line, I feel it my duty to say that melon seeds in large quantities, as well as grapes, are harmful to poultry. I have raised hundreds of chickens and turkeys each year, along with melons. No doubt melon seeds and rinds throw out from time to time would produce no noticeably ill effects, but having large waste of both grapes and melons as we do here on the ranch, we have found them injurious. The poultry, in their greed for this luxury, will leave more substantial feed, and the acid in both and the lack of nourishing qualities, weaken their systems. With the days and nights yet warm the fowls may exist, but the chilly nights and weakened systems soon tell the tale of injury, and symptoms such as were described in the former query, appear. If from this cause they have become poor and mere skeletons, I would suggest separating the weak ones in a little run by themselves, with a warm roosting place, and giving them mashes with a little chili or condition powders.—Mrs. C. O. Hayward, Thermal.

It is stated that spraying the hen house with a very strong solution of common salt will as effectively destroy lice and mites as other mixtures commonly used. Clean out thoroughly the hen house before spraying, and do the work in the morning, giving the salt a chance to crystallize before night.

## AGRICULTURE IN ALASKA.

PROPHECIES when considered in the years after their delivery are always interesting, and so perhaps the words delivered by President Roosevelt, when addressing an audience at Seattle in 1903, are curiously effective in the light of their partial fulfillment today, and the certainty of their absolute realization within a short time. He said:

"The men of my age, who are in this audience, will not be old men before they see one of the greatest and most populous states of the entire Union in Alaska. I predict that Alaska within the next century, will support as large a population as does the entire Scandinavian peninsula of Europe, the people of which by their brains and energies have left their mark on the face of Europe. I predict that you will see Alaska with her resources of minerals, her fisheries and her possibilities that almost exceed belief produce as hardy and vigorous a race as any part of America."

Professor C. C. Georgeson, the special agent of the Department of Agriculture, in charge of investigations in Aaska has borne out the prophecy, in a recent interview, for he has said:

"The impression that Alaska is a barren, snow-covered waste is well nigh universal. But during the last half-dozen years the reports of returning Klondikers, who have seen the luxuriance of the vegetation and have tasted the delicious qualities of Alaska vegetables, have somewhat modified the illusions in regard to the Northland on this subject. Alaska has great agricultural possibilities, but as in all northern countries the possibilities are limited to the culture of hardy crops. An inhabitant of the central West is apt to think that a country that cannot produce corn is of little value agriculturally. He forgets that corn is not grown in the most populous and most distinctly agricultural countries of Europe. Corn is not grown in England, in northern Germany, in Denmark, in Sweden, in Norway, or in the vast expanse of Russia and Siberia, north of the fiftieth parallel. Alaska's possibilities are limited in grain crops to the growth of barley, oats, rye, buckwheat and some wheat. All the hardy vegetables are grown successfully—potatoes, cabbage, cauliflower, rutabagas, turnips, carrots, parsnips, peas, lettuce, raddishes, rhubarb, etc., but, it is a revelation to most people that even these crops can be grown there.

"The area of Alaska is, in round numbers, 590,000 square miles. Out of this total area it is estimated that approximately 100,000 square miles can be utilized for agricultural and for grazing purposes. The territory has never been surveyed, and we have therefore no acurate data on which to base estimates, but in round numbers the lands that can be converted into agricultural and grazing lands are distributed as follows: In the coast region 15,000 square miles; in the Yukon valley about 30,000 square miles; the Tanana valley, 15,000 square miles; the Copper River valley, 15,000 square miles; the Susitna and Matanuska valleys, about 15,000 square miles; and the Kuskokwim valley, 10,000 square miles.

"That the hardy vegetables can be grown in all of the valleys up to the Arctic Circle, and even beyond, has been demonstrated by miners, prospectors, and other settlers in Alaska for many years past. There is no longer any dispute on this question. Not only can vegetables be grown, but Alaska produce is the finest in the world in point of quality. By reason of the long hours of daylight, the growth is very rapid, which produces a crispness and flavor that are not approached by vegetables grown under a scorching sun.

"That barley, oats, rye, and wheat can be grown in Alaska has been demonstrated at the Government experiment stations. An experiment station has been maintained for eight years past at Rampart, in the Yukon valley in latitude 65 degrees 31 min. At this station, we have never failed to mature barley and oats, and in some seasons when the snow fall was sufficient to protect winter grains we have also matured winter rye and winter wheat.

"More recently the Government has attempted to experiment with cattle raising on a large scale. A small herd of purebred Galloways has been imported and a cattle-breeding station has been established at Kodiak, on Kodiak Island. The Galloways were selected because they are by nature adapted to a cold and wet climate. They are a beef cattle, but some among them are good milkers, and one of the experiments which have been outlined is to develop their milking qualities and thus make the Galloways an all-purpose breed, which will meet the needs of settlers in Alaska.

"The question is frequently asked if Alaska will ever be settled with farmers. This can be answered in the affirmative. The territory has a special homestead law that permits a person with homestead rights to take up 320 acres subject to the provisions of the law. Several hundreds of men and women have taken advantage of this act, and these are now among the pioneer farmers of the territory. When located near a good local market, they receive high prices for their produce, which consists chiefly of vegetables, berries and hay. The price received for these articles is governed by the cost of transportation of similar produce from Puget Sound.

## EXAMINATIONS FOR FORESTRY SERVICES.

Examinations will be given in various cities of California on October 25th to 26th to determine qualifications of applicants for positions in the forest service. They will be held in Los Angeles, San Diego, Santa Barbara, San Luis Obispo, Hot Springs, Yreka, Alturas, Salinas, Sonoma, Quincy, Sisson, North Forks, Weaverville, and Nevada City.

---

Some people are so afraid of falling from the ladder of fame that they never start to climb.

---

Good work may be done with poor tools but it's always at a disadvantage.

---

Woven wire fence is best in the long run.

Mr. Hackett and his son were discussing their new barn.

"Well, Dad, how about the roof?"

"I guess shingles are good enough, aren't they?"

"Now hold on, Dad—'good enough' don't go. You know that shingles don't make a perfect roof by a long shot—burn too easy and sure to leak."

"How about slate?"

"No! Too expensive—winds' too strong around here—and we couldn't lay 'em ourselves."

"Well, why not try one of the best of those prepared roofings that come in rolls?"

"Fine! I've seen it tested—one brand, Rex Flintkote Roofing, was the greatest stuff I ever saw—wouldn't catch fire from live coals—waterproof, too."

"All right, Bob. Rex Flintkote it is. I'll write to J. A. & W. Bird & Co., 33 India Street, Boston, the makers, for facts and name of their nearest agent."

Pacific Coast Agents: W. P Fuller & Co., San Francisco, Sacramento, Oakland, Stockton, Los Angeles, San Diego, Portland, Seattle, Tacoma, Spokane.

Why Buy the International Auto?

Because It saves money in operating expense.

Because It avoids 90% of the ordinary automobile troubles with pneumatic tires—no punctures, no blowouts.

Because Air cooling does away with a cumbrous water cooling system, and obviates leaking radiators.

Because The engine is built for long service and to eliminate repairs.

Because Of the many other reasons that we want to tell you of in detail.

### Lung Worms.

Some of my calves began coughing and grew so thin and weak that they could hardly stand, and some died. Examination of dead body showed presence of thread like worms three inches in length in the lungs. Calves had been pastured in an orchard where there were many fallen apples. Could this have caused the condition? Is smoking with sulphur of any value?—J. A. G., Ferndale.

This trouble is not contagious, but is infectious. The animal affected should be promptly removed from healthy ones. The pastures must be treated carefully to kill the eggs or larvae in wet weather. These worms increase with great rapidity. Burning off infected land and then plowing it up and planting a green crop that is again turned under, will free it from the eggs. Stagnant water will also hold and pass them along. The treatment is not very successful, but fortunately is simple. Take the infected animals and put them under shelter in a building where they can be kept warm and fed well. Coat the ground or floor of this building every day with oil of creosote, or with crude oil made lighter with engine distillate. This will prevent the reinfection of the calves. Stamping out the trouble is to be considered rather than saving the calves already affected. Have the druggist make a mixture of equal parts of ether, chloroform, and oil of turpentine. Hold the calf's head up slightly and pour a teaspoonful down the nostril, continue holding the head for one minute then repeat on the other nostril. Add some oil meal boiled to warm new milk and feed several times a day. Turn attention to stopping the disease by cleaning up the source of the trouble. If the ditch comes from land infected by this trouble it would certainly carry it. I believe this trouble has been in Humboldt county for some time. The only time I ever saw it was some ten years ago when a large number of calves were brought from there to Fresno county. Many proved to be affected and yet the disease was stamped out here at once so that it has not reappeared, after the first lot brought had either passed away or been cured. The dry heat was enough to destroy it completely, Dr. Stiles of the government service was in charge of an outbreak of this trouble in Texas some years ago. Down there it attacked grown steers as well as calves. In summing up his report to the government, he says: "I know of no treatment which can be relied upon to kill the lung worms of cattle and sheep, and I believe their effects upon the health of the animals have been greatly exaggerated, except, of course, in very severe infections. Fumigation and all the forms of fumes were tried and reported on in the suppression of the Texas outbreak. They are not regarded as helpful. Where used strong enough to produce pneumonia and death in the steers treated, the worms were not affected.—M. E. S.

### Sorghum.

I have sorghum planted on 20 acres, from which I already have made two cuttings of about seven tons and will get another in November of three tons per acre. I would like either to get rid of this stubble, or better still, replant it to sorghum next spring. It is the Red Top variety. The experience here is that the land, the year following the sorghum crop is almost worthless for anything else, owing to the roots it leaves, and even with corn, the sorghum will spring up all over the field and outgrow the corn. It is claimed that sorghum exhausts the land and should not be grown for more than one year. Is this so?

Would it be safe to plant sorghum again on this land? If not, what crop would you suggest? Should the sorghum be plowed up before or after it becomes dormant this winter?—T. M. P., Mercedes, Tex.

I should not hesitate to plant land again to sorghum. A little fertilizer would not cost as much as replanting a piece of any size. Is it necessary however to use it? I have been using sorghum to clean off land infested with morning glory and have one patch that has grown sorghum for the seventh year. I cannot see that this summer's crop is any lighter than last season's. This land has not been fertilized, but has been planted every winter to either oats and peas or barley and peas. The sorghum land after the last crop has been harvested is pastured off by cattle and as soon as the rains fall, usually in December, the plows start in on it. We grow the Early Amber variety and it does not trouble us with roots that are unmanageable. When we grow the non-saccharine varieties, we find the roots have to be cleaned off. This is quickly done by running a heavy straight toothed cultivator over the land to bunch them in long windrows, which are burned off after three weeks and give no further trouble. If the sorghum is in drill rows, we find that on clean land not infested with morning glory it pays to drill in peas before the sorghum is cut and then after cutting let the peas grow for a winter crop. After all the green peas have been sold that the market will take, the vines and peas on them are harvested for hay or may be put into the silo. The land is then ready for sorghum once more. The greatest difficulty with sorghum is overcome by sowing in long drill rows three feet apart and cultivating it well. I think here in California that any difficulty coming from sorghum impoverishing the land is from lack of moisture during the growing season. Whenever a crop will stand all sorts of hardships it is apt to receive them. Sorghum will make a crop with a minimum amount of water, and only a trifle of cultivation, yet if it is well irrigated and well cultivated it will make four or five cuttings in the season just as well as three, the usual number.

I would plant peas if sorghum is not wanted again. Plow while dormant to destroy the roots if the land is to be cleaned up. Next summer corn or sorghum will give a good crop after the peas are off. I have only been able to give you the way I handle this crop at home here for I am not familiar with the Texas conditions.—M. E. S.

### Inoculation of Alfalfa.

Please give method of inoculating alfalfa seed with soil from good alfalfa field. What is your opinion of Turkestan and Arabian varieties?—L. M. L., Chino.

For inoculating alfalfa land the best growing spot in the old alfalfa field is selected and vigorous plants chosen. They are dug up and the roots examined. If well set with nodules, the surrounding soil to a depth of eighteen inches is taken for inoculating and placed in a barrel at once and covered to keep the sun from it. One barrel of the 60 gallon size, filled with soil, is enough for one hundred pounds of seed. The soil is taken into the packing house and spread on the floor or on sweat boxes, two inches deep. It is then covered well with alfalfa seeds. Use a rose nozzle watering can to sprinkle the water on it. Wait a few minutes, then turn the earth over the seed with a hoe, working it like mortar. If not enough water has been used, add more, or if too much, add some earth. This is done in the afternoon and the next morning the seed is sown. Avoid exposing the seed to the light, and harrow it as quickly as possible. I have pulled up alfalfa planted in this way when three inches high, and found two nodules on the roots. When the plants are a foot high they will be found to have the roots well studded with them.

Turkestan alfalfa has the advantage of greater hardness. It will stand drought better than the common variety and also grows at a lower temperature. It will not in its main crops give any more hay, but it comes on earlier in the spring and may be cut for soiling long before the other alfalfa. The Arabian is not quite as hardy as the Chilean and makes less winter growth, but grows taller in the summer heat. I have not had enough experience to say if the crop is much greater. I often think these newer varieties have the advantage of better care than the commoner things we grow. The things that we are trying on the side interest us most and are therefore a little better treated. With cows this is certainly true, for Alex would fight if any one slighted or hurt Minnewawa Juliana, while in the case of other cows he would simply be very cross. We all make favorites of certain things. I have one acre of Turkestan alfalfa planted last year and a few strips two feet wide and thirty long of several varieties of Arabian. Last spring was very unusual in the long drought beginning in March. I did not secure much of a stand on any of this land, but have a few plants that I have nursed through the summer, I hope they will give better results next season.—M. E. S.

### Irrigating Peas.

I have peas planted the latter part of September and the first part of October. How wet should the ground be kept, if they are to be irrigated at all? They are planted in drills in orange orchard and are intended for market.—A. M. W., Success.

Necessity for irrigation is determined by lack of rainfall or otherwise, and the general condition of the soil where the peas are planted. By examining the plants to see if they are growing thriftily you can tell when they are in need of irrigating. Wherever peas are planted in an orchard the ground should be left so that furrows can be filled with water at any time.

### Self Milkers.

We have a cure for self milkers which we saw in an eastern paper. I have found it a good thing and wish to pass it on. I have not found the stake attched to surcingle a success. My plan is simply to use the ordinary bull ring with two other smaller rings attached. This has proved entirely satisfactory with our cow.—A. H. Hurlburt, Santa Cruz.

This may prove successful in some instances, but, as Mrs. Sherman will say in her department next week, there are cases where even it is not satisfactory.

**For Sale, Fine Lot of Orange Seedbed Stock**

**Both Sweet and Sour**

Also one-year Navel and Valencia Buds, ⅝ in. up. For particulars call on or address

**T. J. Locke**
27 North Stoneman Avenue
Alhambra, California

**Gum Disease Cured**

A never-failing remedy for Gum Disease or Scaly Bark in Citrus Trees. For further particulars, address

**W. W. BLISS,** Duarte, South Cal.

### El Cajon Valley.

Are the conditions in El Cajon Valley, San Diego County, favorable to the growing of almonds and walnuts? It is sometimes very hot in the summer and light frosts come in tho winter. Soil is decomposed granite, very deep.—Subscriber, El Cajon.

It is very difficult to say without more definite knowledge as to the possibilities of those two nuts in that section. We have learned of walnut orchards planted in this Valley which after several years growth proved unprofitable. This, however, was said to be partly due to the fact that the sub-soil was impregnated with alkali, and when the roots entered this soil they were destroyed. The deep soil which you mention should be suitable. Frost in winter when the trees are perfectly dormant would do no harm, and would not be injurious except at blossoming time or after. This question will be referred to one of our field workers who will later give more definite information. Walnuts are subject to sunburn which makes them not an ideal hot section product.

### Gum Disease.

What treatment is advised for gum disease on orange trees?—D. R., Arlington.

See answer to similar query in last week's paper, and write to Agricultural Experiment Station, College of Agriculture, Berkeley, Cal., for Bulletin No. 200 which gives a detailed description of the disease and its treatment.

### Orange Seed.

What kind of orange seed is best to plant? I wish to start some trees for myself. They are to be budded to navels. Where can seeds be obtained and what variety is best to plant?—P. E., Redlands.

The kind of seed to plant depends somewhat upon soil conditions in which trees are to be finally placed. If in heavy or damp soil where there may be danger of gum disease, the sour stock is usually preferred, otherwise, either the sweet seedling or pomelo seeds are satisfactory. The greater proportion of our trees is grown on sweet seedling stock. If you are near a sweet seedling orchard, you probably can secure culls and rot them down and secure your own seed, or you can buy them of any seed house. Seeds should be planted in the springtime, March or April.

### Windmills for Irrigation.

Is the windmill of sufficient power to prove practicable? Does it have capacity enough to supply any head? Do not the people of Holland use them for irrigation? What do the mills at Sutro Heights accomplish, and what is their capacity? Is the over shot or Jumbo mill of any value? What would be the limit of power and capacity, say with a lift of 150 feet? We have a strong north wind that blows about six months in the year.—T. G., Greenfield.

It would be impossible to answer all the foregoing questions without knowing further particulars. In a general way we may say that any such lift as 150 feet would be out of the question with a windmill. In fact, anything more than twenty or thirty feet requires so much power that the windmill would not be practical. We presume they are used in Holland for irrigation purposes. We know they are very largely used in Florin, Sacramento county, where one mill is required for about every two acres in the small fruit growing section. The lift is very slight and the small stream is changed from day to day and the wind mills do very well. These mills are very cheaply made, in fact, are the home made stationary mills, always catching the wind from the one direction. They are not the over shot, which we do not think have proved successful, at least have not been generally accepted. We cannot say as to the mills at Sutro Heights. We have regarded them more as an ornamental feature than as of any practical use. The number of miner's inches and the capacity would depend so much on the velocity of the wind and its permanence, that without definite figures a definite answer could not be given. As a rule, we think the gas engine has proved more satisfactory, and certainly if any material quantity of water is desired, it would be necessary.

### Churning Problem.

I have a cow that has been fresh six weeks, but I am unable to make butter from her milk. I feed alfalfa. Before being fresh she made fine butter. The milk seems to have plenty of cream, but churns to a thick oil. She gives five gallons a day, before about one and one-half gallons. Have tried a few sweet potatoes, but to no avail.—T. H. W., Anaheim.

Try making the temperature of the cream at churning time lower and give the cow a little rolled barley to harden things up a little.

If you could secure a little buttermilk from a neighbor and add it to the cream a few hours before churning this active bacteria of one form might be brought under control. High temperature of milk or cream will throw up the oil of butter often from fresh milk. In the summer I often notice some clear oil floating on the milk when it is turned into the milk vat. I never saw this in cool weather so believe that temperature has more to do with it than anything else.—M. E. S.

### APPLE KING OF AMERICA.

This title belongs to Judge Fred Wellhouse, of Topeka, Kansas, who owns over 1600 acres devoted to apple trees, and who has made apple growing a life study. Writing about Judge Wellhouse in "Surburban Life," Hon. F. D. Coburn, secretary of the Kansas State Board of Agriculture, says: "When in the late seventies he was planting 437 acres to apple trees in Leavenworth county, Kansas, many of his neighbors looked upon him as well-nigh demented. Over four hundred acres in orchard; it was astonishing! So said the croakers; but Wellhouse, undaunted and undiscouraged, worked on unmindful of the bantering and rallying, and the outcome justified his faith in Kansas and himself and forever silenced those who doubted."—Green's Fruit Grower.

# Classified Liners

Rates 1½ cents per word per issue No ad accepted for less than 25 cents. Our classified columns are the clearing house for the readers of the Cultivator. Here you can insert an ad for the small sum of 1½ cents per word per issue, and be sure that it will be read by thousands.

## MISCELLANEOUS.

THE ANCHOR EGG SEPARATOR works perfectly; no well regulated hotel or household can afford to be without it." So says Delmonico's Chef. Send ten cents or ten names of persons keeping poultry, and we will send one postpaid. Or for 25 names we will also send postpaid "THE POULTRY MANUAL" by those high authorities, F. L. Sewell and Ida R. Tilson, profusely illustrated. WEST COAST MILL CO., 705-709 So. Griffin Ave., Los Angeles, Cal.

A LABOR SAVER FOR WOMEN. Send 10 cents for three weeks trial. Electric Laundry Compound, washes clothes without rubbing. Saves time, labor, and clothes. No lime, lye or acids. Eight washings 25 cents. Money back if not satisfied. ELECTRIC COMPOUND CO., 823 S. Spring St., Los Angeles, Cal.

FORTUNES IN SUGAR—STOCK FOR sale in a new sugar cane plantation. Small monthly payments will secure for you an interst in this great enterprise, that will pay you an annual income for life. Write for booklet, LOS HORCONES PLANTATION CO., 724 Grosse Building, Los Angeles, Cal.

PRODUCER TO CONSUMER—Write to me today for prices on dried fruits. We raise them and Banning fruit is of the best. If you like fruit, our prices are low enough, you can afford to eat fruit the year round. Write now to CHAS. W. MIXTER, Banning, Cal.

HEALTH—LATEST SCIENTIFIC DISCOVERY. You positively can renew your youth and prolong your life. Our book "How to Live 100 Years" and 15 sheets of instructions for 50 cents. NATIONAL HEALTH LEAGUE, 545 Douglas Blk., Los Angeles, Cal.

A GOOD INVESTMENT. MOST MEN are working for money. The wise man makes his money work for him. Write for prospectus. COLUMBIA COMMERCIAL COMPANY, 204 East 9th street, Los Angeles, Cal.

WANTED—HARDSHELL ALMONDS for seed purposes. Address, FANCHER CREEK NURSERIES, Fresno, Cal.

## HORTICULTURAL PRINTING.

THE KRUCKEBERG PRESS, 123 South Los Angeles St., Los Angeles, Cal., makes a specialty of Horticultural Printing and Engraving. Cuts and illustrations of all standard, economic and ornamental plants on hand and subject to the use of patrons without cost. Samples and estimates cheerfully furnished. Remember we design, write, engrave, bind and print; in brief, do the "whole thing," at no additional expense to the customer. Correspondence a pleasure; a personal visit a joy. Headquarters for catalogues and quadri-color printing.

## RUBBER STAMPS.

SEND IN YOUR ORDERS FOR RUBber stamps, dies, stencils, etc. Catalogue on request. F. W. HOPKINS PTG., CO., 641 S. Main St., Los Angeles, Cal.

## GRAPE VINES.

CHOICE GRAPE VINE ROOTINGS, Tokays a specialty, all varieties at market prices. ATLANTA NURSERY CO., Louis Vistica, Manager, Atlanta, Cal.

## POULTRY.

FOR SALE—RHODE ISLAND REDS (Tompkins Strain), Rose and Single Comb Black Minorcas (Northrup Strain), White Minorcas. Day-old chicks hatched to order, and eggs in season. C. U. CHAMBERLIN, Los Gatos, Cal.

THE 20TH CENTURY COOP IS THE best house on the market for continuous housing. Blue-prints with specifications and photograph of coop $1.00. Address, MRS. A. J. BADGER, Oxnard, Cal.

WHITE WYANDOTTES—NOW IS THE time to buy your male birds for the breeding season. I have some extra good cockerels for sale $1.50 to $5.00 each. Call or write today; tomorrow may be too late. S. P. MOORE, 506 Casco St., Los Angeles, Cal.

FOR SALE--FIVE MAMMOTH BRONZE turkey hens two years old, one tom two years old and one tom seven months old. None larger or finer marked in the state. PETER JENSEN, Brawley, Cal.

PIT GAMES—SOUTHERN AND GRADE Japs. O. L. CRANE, Route 3, Santa Rosa, Cal.

## FERTILIZERS.

SULPHATE OF POTASH
$60.00 per ton.

For a short time we will sell Sulphate of Potash at $60.00 per ton.

This is the right time to apply it for maturing the crop and the new growth of wood.

This price won't last. Get your supply now from the Armour agent in your district.

THE ARMOUR FERTILIZER WORKS, Los Angeles and Colton.

## HARNESS.

THE MOST RELIABLE HARNESS manufacturers in San Francisco will make to your order any kind of harness you may want from the best stock, at wholesale rates, all goods guaranteed as represented, or money returned. We carry large stock of our make harness on hand for immediate shipment. Write for catalogue. LASTUFKA BROS. & CO., 1659-61 Market St., San Francisco, Cal.

## HONEY.

SAGE HONEY, GUARANTEED ABSOlutely pure. One 5 gal. can, crated, f.o.b., $4.25, two 5 gal. cans, crated, f.o.b., $8.00. HENRY E. HORN, Riverside, Cal.

## DOGS.

BLUE BLOODED ROUGH COATED Scotch Collie puppies, perfectly marked in sable and white. Stock workers a specialty. RANCHO CALAO, Mountain View, Cal.

FOR SALE—THOROUGHBRED GORdon Setters, Scotch Collie, and two Cocker Spaniel pups. 2312 REDWOOD AVE., Fruitvale, Cal.

## THE LAND OF NOD.

From breakfast on through all the day
At home among my friends I stay;
But every night I go abroad
Afar into the land of Nod.

All by myself I have to go,
With none to tell me what to do—
All alone beside the streams
And up the mountain-sides of dreams.

The strangest things are there for me,
Both things to eat and things to see,
And many frightening sights abroad
Till morning in the land of Nod.

Try as I like to find the way,
I never can get back by day,
Nor can remember plain and clear
The curious music that I hear.

—Robert Louis Stevenson.

## HOW TO MAKE LIFE PLEASANT.

IT IS a secret worth learning, to know how to be cheerful one's self, and how to make other people, and especially the home circle, happy. Some people seem to live in perpetual sunshine and wherever they go carry sunshine with them; others diffuse a kind of chillness and gloom and are always managing to say uncomfortable things. There are some persons who seem to treasure up things that are disagreeable on purpose. I can understand how a boy that never had been taught better, might carry torpedoes in his pocket, and delight to throw them down at the feet of passers-by and see them bound; but I cannot understand how an instructed and well meaning person could do such a thing. And yet there are men that carry torpedoes all their life, and take pleasure in tossing them at people. "O," they say, "I have something now, and when I meet that man I will give it to him!" And they wait for the right company, and the right circumstances, and then they out with the most disagreeable things. Have you a right to take up any little story that you can pick up about a man, and use it in such a way as to injure him, or give him pain? And yet how many there are that seem to enjoy nothing so much as inflicting exquisite suffering upon a man in this way, when he cannot help himself! Well, you know just how the devil feels! Whenever he has made somebody very unhappy, and laughs, he feels just as, for the time being, you feel, when you have done a cruel thing, and somebody is hurt, and it does you good.

This bears on another point—that of saying pleasing things instead of disagreeable things. There is a person that never fails to say a pleasant thing when I meet him. If for the sake of saying a pleasant thing he ever said an untrue thing, I should be sorry; but I trust that all of us do things in one place or another that are sufficiently praiseworthy to justify their being pleasantly spoken of; and I would rather have a person take notice of my good points than of my bad, and speak of them. It makes me happier, and I feel better toward everybody else. I suppose you feel happy when you are praised, do you not? I suppose that, for the time being, you feel benevolent. But this saying of pleasant things is often inveighed against by persons who, not being alive to the duty of pleasing, and not having a natural desire to please, think that many of these little attentions which people bestow on each other are foolish. For instance, if, meeting you, I see anything pleasant about you, and say, "You are looking well," they stand back and say, "Flattering him! telling him that he looks well! Suppose he is handsome, is that any reason he should be told of it?" Yes, if being told it adds to his happiness. If a person meets a friends and says, "This is a charming dress you have on," they say, "Why should you talk to her about her dress, and tell her that it is beautiful?" Because it will please her.

If a man has done anything that is creditable; if he has written an article, or issued a poem, or made a speech, or effected a bargain, or built a house, or done anything else that reflects credit upon him, is it best to praise him for that, or to find fault with him for something he has done that is not so creditable? Is it best to encourage men by commending them for that part of their conduct which is commendable, or to discourage them by holding up to condemnation that part of their conduct which is faulty? I know that there is danger of going to extremes in this direction; and yet it is right for us to maintain a thousand courtesies that tend to give pleasure, and to avoid many rudenesses that tend to give pain. Choose things that will please men. Nutgalls are not the only things in the world. There are roses and honeysuckles. Wasps are not the only things in the world. There is honey as well.

In the family, the law of pleasing ought to extend from the highest to the lowest. You are bound to please your children; and your children are bound to please each other, and you are bound to please your servants, if you expect them to please you. Some men are pleasant in the household, and nowhere else. I have known such men. They were good fathers and kind husbands. If you had seen them in their own houses, you would have thought that they were angels, almost; but if you had seen them in the street, or in the store, or anywhere else outside of their houses, you would have thought them almost demoniac. But the opposite is apt to be the case. When we are among our neighbors, or among strangers, we hold ourselves with self-respect, and endeavor to act with propriety; but when we get home we say to ourselves, "I have played a part long enough, and am now going to be natural." So we sit down, and are ugly, and snappish, and blunt, and disagreeable. We lay aside the thousand little courtesies that make the roughest floor smooth, that make the hardest things like velvet, and that make life pleasant. We expend all our politeness in places where it will be profitable—where it will bring silver and gold.

My friends, our kindness should begin at home. It should not stay there; but there it should begin, and there it should be nourished. And nowhere else should you be so considerate of politeness as in your own house, when there is nobody there but your wife and children; for what has a man that is worth more to him than his wife and children!—Orffs Review.

THE SAVINGS AND LOAN SOCIETY.
101 MONTGOMERY ST.
SAN FRANCISCO

IT is the policy of this Institution, which is **Strictly a Savings Bank,** to extend every possible courtesy to all of its patrons. Deposits of one dollar or more are invited.

### PINEAPPLE RECIPES.

**Pineapple Pie.**

Line a ten-inch pie plate with any good pastry crust and fill with a can of crushed or grated pineapple to which has been added a full cup of sugar and a teaspoonful of cornstarch moistened in water. If a larger pie is wanted from one can of fruit, add tart, juicy apples, sliced or chopped.

**Pineapple Tarts.**

Make good butter pastry, roll out very thin and line twelve small or six large patty tins. Divide the contents of a can of Hawaiian Pineapple, either grated or crushed, equally among the tarts, adding a small teaspoonful of sugar if a sweet, rich tart is liked. Bake very quickly and serve fresh.

**Hawaiian Pineapple with Cherries.**

If an ornamental dish is desired, add to a can of Sliced Hawaiian Pineapple one small bottle of Maraschino cherries. This may be served in sherbet glasses if preferred by cutting the pineapple into sections.

**Hawaiian Pineapple Salad.**

Sliced Hawaiian pineapple makes an excellent salad course for a ladies' luncheon. Serve it with other fruits or alone, dressed with mayonnaise or French dressing on lettuce leaves. It is excellent when mixed with grapefruit, tart apples or halved Malaga grapes. The syrup should be drained off and reserved for sherbets or pudding sauces.

**Pineapple Shortcake.**

Make a rich biscuit crust, very short and slightly sweetened. Bake in a sheet or round fully an inch thick. Split while hot and butter generously, spreading the top thickly with crushed or grated pineapple. Serve with or without cream.

**Pineapple Jelly.**

Soak a box of gelatine in a cup of cold water until it is soft. Add a lemon sliced thin without removing the rind and two cups of sugar. Dissolve with three large cups of boiling water and strain through cheese cloth or a very fine sieve. Add a can of crushed or grated pineapple. The fruit will be distributed more evenly through the jelly if it is not added until the latter begins to cool, but has not yet set.

---

"What is a cannibal, pa?"
Asked little Harry Dann.
"A cannibal is one, m' boy,
Who loves his fellow man."

—"Lippincott's."

| Light Amber | 10@12 |
| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

Scott, Magner & Miller say:

Arrivals of hay for the week have been 4100 tons, which shows an increase over last week's arrivals. Large quantities of hay have been rushed in from the river banks, and these arrivals have constituted the larger part of the above amount received. Arrivals by railroads have been moderate for the last ten days.

The warehouses are being broken into, and consignments being sent forward to this market from storage.

Feed grains are high, and the consumer is thoroughly adverse to being compelled to pay any further advance in the price of hay.

Alfalfa has has been a heavy factor in the arrivals during the week, as large quantities are being rushed in by water from the river districts to get the fields entirely cleaned up before our heavy rains. Prices on this article are lower, and the market fully stocked.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 19.00@20.00 |
| No. 1 wheat or wheat & oat | 17.00@18.00 |
| No. 2 wheat or wheat & oat | 14.00@15.00 |
| Choice tame oat | 16.50@17.50 |
| Other tame oats | 14.00@15.00 |
| New crop wild | 11.00@15.00 |
| Stock hay | 8.00@9.00 |
| Alfalfa | 10.00@13.00 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.35@1.46¼ |
| Barley No. 1 | 1.72½@1.77¼ |
| Oats white | $1.55@1.60 |

| Middlings | 36.00@37.50 |
| Mixed feed per ton | 28.00@32.00 |
| Shorts | 31.50 |

## Deciduous Market

The California Fruit Distributors reported Monday of fruit sales in the East as follows. 1 carload sold in Boston by Distributors; 5 in Philadelphia by Distributors; 2 in Minneapolis by Distributors; 18 in Chicago, 10 by Distributors; 20 in New York, 10 by Distributors.

Prices averaged as follows:

Chicago—Tokays, 70c to $1.35; Malagas, $1.25; Italians, $1.10; Cornichons, $1.20.

New York—Tokays, $1.12; Malagas, $1.15; Pomegranates, irregular quality, averaged 87c.

## Citrus Market

LOS ANGELES, Oct. 20, 1909.

Valencias are commanding the highest price of the season and assurance is felt that the few yet remaining will command still higher prices. As there are but few cars yet to ship, it is very probable they will be picked up by buyers who seem anxious to have them stored. The early shipments from Tulare and Butte counties will probably begin not far from November 1st, but there will be some holding of Valencias for the trade which prefers them to new fruit.

Lemons are commanding the biggest price since the Fourth of July. Foreigns are selling on New York docks at exceedingly strong prices and the few going forward from California do not begin to meet the requirements of the trade. Only about four or five cars are shippped daily now. The quality of the stock is exceptionally good.

**SHIPMENTS.**

Total shipments of citrus fruits since Nov. 1, 1908, 37,713 cars, of which 31,615 were oranges and 6,098 lemons.

---

NEW YORK, Oct. 13.—Four cars oranges sold. The market is very strong and active, with prices somewhat higher. Weather clear and cool.

| VALENCIAS— | Avge. |

## SHORT HISTORY OF ENGLISH AGRICULTURE.

A book which should be in every complete agricultural library, and of especial interest to those who wish to be informed as to agricultural history as well as agricultural products, is one of the above title published by the Oxford University Press, whose American branch is at 29 to 35 West 32nd St., New York. The book is written by W. H. R. Curtler. In the preface the author says: "Agriculture is, beyond all doubt, the foundation of every other art, business and profession, and it has therefore been the ideal policy of every wise and prudent people to encourage it to the utmost, yet of this important industry, still the greatest in England, there is no history covering the whole period." The book contains twenty-three chapters, with statistical appendix and good index, and treats of farming from the very earliest communistic efforts down to the most modern methods. One interesting paragraph we note is a quotation from an ancient document describing the duties of a reeve, giving details of 11th century farming as follows:

"In May, June and July one may harrow, carry out manure, set up sheep hurdles, shear sheep, do repairs, hedge, cut wood, weed and make folds. In harvest one may reap; in August, September and in October one may mow, set woad with a dibble, gather home many crops, thatch them and cover them over, cleanse the folds, prepare cattle sheds and shelters ere too severe a winter come to the farm, and also dlligently prepare the soil. In winter one should plough and in severe frosts cleave timber, make an orchard, and do many affairs indoors, thresh, cleave wood, put the cattle in stalls and the swine in pigstyes, and provide a hen roost. In spring one should plough and graft, sow beans, set a vineyard, make ditches, hew wood for a wild deer fence; and soon after that, if the weather permit, set madder, sow flax seed and woad seed, plant a garden and do many things which I cannot fully enumerate that a good steward ought to provide."

## GROWTH OF SUGAR BEET.

The growth of a beet plant from germination to maturity may be roughly divided into three distinct periods, with respect to its needs of water. During germination only a moderate amount is required. But as soon as six or eight leaves are formed the plant can use enormous quantities, and at this time, it is almost impossible to drown it. During the maturing period, when the sugar is forming, a gradual lessening of moisture must take place. This means that there are practically two periods when water can be applied to the best advantage with our method of flooding,—flooding, by the way, being superior to all other methods of applying water under our condition. The plant itself is a good index of its needs and whenever during the time of rapid growing deep purplish or dull color takes the place of the usual healthy vivid green, or wilting plants do not revive over night, water must be applied. On the other hand the plants must never reach a yellow stage, unless that yellowing is a sign of approaching maturity. Water applied then will either do no good or else prove harmful by breaking down the sugar and inducing a secondary growth. The wise use of water is the secret to success.—R. L. Adams.

Feed sold from the farm in the form of butter-fat and pork brings the best profits.

The barn that can be kept most clean and sanitary is floored with cement.

Pure bred farm stock is the only kind that pays under any circumstances.

# Business Notes

### U. S. SEPARATORS WIN GRAND PRIZE AT SEATTLE EXPOSITION

It will not surprise any one who has used a United States Cream Separator to learn that this separator was awarded the Grand Prize, the highest possible award, at the Alaska-Yukon-Pacific Exposition at Seattle, Wash. The award made by expert judges confirms the testimony of dairymen and farmers throughout the country, who have put this sterling separator to the test day after day on the farm.

It is interesting to note that the United States Separators exhibited at the Seattle Exposition were ordinary stock separators. No extra finish was put on them. They were all ready to go to work separating milk and in fact, they will be sold and at work before this article is read. The Vermont Farm Machine Co. has claimed for its United States Separators that they are exceptionally easy running, easy cleaning and long lived, and possess the highest degree of skimming perfection. The award of Grand Prize bears out these assertions.

The farmer who does not own a cream separator and who intends buying one is naturally interested in what others think of the merits of the various makes of separators. He depends on the testimony of actual users, and expert judges. The United States Separator is fortunate in having so many loyal users of its machines, who never miss an opportunity to "talk United States," and also in having received such unanimous approval in the shape of awards by exposition judges. The combination of these two recommendations cannot fail to impress the prospective buyer of a separator. And he makes no mistake in following such advice and buying a United States.

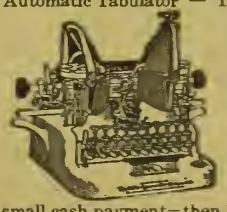
**A $100 Typewriter for 17 Cents a Day!**

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."



**Yours for 17 Cents a Day!**

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

**A Quarter of a Million People are Making Money With**
**The OLIVER Typewriter**
**The Standard Visible Writer**

The Oliver Typewriter is a money-maker, right from the word "go!" So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

**"An Oliver Typewriter in Every Home!"**

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

# Vast Forests Used in Production of Paper Pulp

Courtesy Superintendent Public Instruction, California.

Slaughter of the forest. The trees are chopped down, peeled, and then the whole surface of the forest is burnt to the bone, so that the logs may be easily and cheaply dragged out.

IF you stood on the top of a tower in the greatest hardwood forests of the South, one sweep of the scythe of civilization would mow it farther than you could see, for one month's use in vehicles, manufactured furniture and farm implements. Prices for this kind of wood have risen from 25 to 65 per cent since 1899. In seven years the production of hardwood has fallen off 15 per cent; and those were the six years of its greatest demand.

It would seem that we cannot much longer afford to read. Neither shall we long be able to write. Last year we made more than 315,000,000 lead pencils. A lead pencil is not very large, but the total number of lead pencils required 7,300,000 cubic feet of cedar. We have cedar enough to last us just twelve years.

More than 100,000 acres of timber in the whole United States are cut over every working day. We use many times more timber per capita than any other nation.

We have left not over 450,000,000 acres bearing commercial timber. Cast up in your mind some of the small demands of industry noted above. Multiply this by three or four to represent the total, including all sorts of sawn lumber. Remember that you are dealing in terms of millions of acres. Divide 450,000,000 by your total number of millions of known demand. What is the result? Do you find it pleasant? Do you remain willing to listen to the charming of those who are either ignorant or hypocritical in their "estimates"?

SOME one has figured that a big Sunday newspaper needs twenty acres of wood pulp to make the paper for one edition. The Chicago Tribune, a chance instance, uses 200,000 pounds of paper each Sunday, or 400,000 each week. Do your own multiplying. We used of domestic spruce alone for pulp wood in one year 1,785,680 cords. The average stand of spruce pulp wood in the regions where it is cut is probably about ten cords per acre; so that of such spruce land we require at least 178,500 acres annually. A ton of paper takes about two cords of spruce in the making—to be exact, about 1,750 pounds of paper pulp.

We use other woods for pulp now, hemlock, balsam, pine, poplar; 3,661,176 cords was our total for 1906. We used in that year 2,327,844 tons of pulp. Since each ton probably cost on the average two cords of some sort of wood, not allowing anything for waste, there were over four million cords cut somewhere mostly in the United States; which means something like a million acres a year for pulp. Call it a half million for close measure. Do some figuring. If it costs twenty acres a Sunday, or forty acres a week, or 2,080 acres a year to print one daily newspaper, what does it cost in acreage to print all the newspapers in all the cities and towns of America? Add to this the paper used in books. The total staggers the imagination, and yet the amount of timber cut for pulp in the United States annually is less than five per cent of what is cut for lumber.

Courtesy Superintendent Public Instruction, California.

This mountain slope was logged over many years ago. Observe that it does not reproduce forest cover, but remains a bare, parched region, at the mercy of sudden flood and summer heat.

# The Curing of Bacon and Hams

## Excellent Points on Pork Curing Written by H. W. Potts, Principal Hawkesbury Agricultural College, New South Wales, Australia, and Appearing in the Agricultural Gazette of That State

IN curing pork for bacon, we have the knowledge that this class of flesh is specially adapted to salting and smoking, by which its digestibility and wholesomeness are increased rather than diminished as is the case with beef and other meats. The granular form of fat in bacon is easy of digestion, and can be eaten by most persons to whom any other fat is intolerable. Hence bacon is frequently used for delicate children, and where the free use of fatty foods is indicated for persons suffering from wasting diseases or requiring readily digestible fatty articles of diet.

It has been determined as a result of ages of experience as well as scientific investigation, that the use of salt in preserving food has no appreciable influence on health other than favorable. Salting is one of the oldest methods known of preserving meat for man's use. Salt acts as a dehydrating agent on flesh; in other words, it removes water retained in the tissues of the animal body. It is also mildly antiseptic in its action, and in this way assists to preserve.

The flesh of the pig does not absorb or take up salt so readily as other meats, owing to the large proportion of fat to lean. The length of time pigs' flesh should be submitted to the influence of salting depends on various conditions. Some breeds of pigs give a greater proportion of fat. The absorption of salt in this case is slower. The size, thickness, age, and weight of the flitches and hams have to be considered.

It requires less time to cure in a damp cellar than in a dry room. The extremes of heat and cold are unfavorable. In the former case, flesh is liable to decompose before the salt permeates it sufficiently to cure it. Where subject to an excessively low temperature, the meat juices become set and the flesh too firm for the salt to penetrate.

### Temperature of Cooling Room.

It should be noted that the temperature of the curing room should never exceed 60 degrees Fahr. Precautions should be observed to have the tables and room in which curing is conducted scrupulously clean, free from dust, and with a sweet atmosphere.

### Salting.

It was at one time deemed good practice to rub the flesh briskly every day, but it is generally found that this is only necessary for the first three days. The salt mixture only requires to be spread over the flesh firmly. An exception may be made in the case of large thick pieces or where the flesh is very cold; then brisk rubbing is an advantage.

The salt should be pressed into every depression and well into the hock ends where the feet have been cut off, and into the joints. To continue the hard rubbing too long results in a hardened cured flesh. Brown sugar is used in varying quantities with salt, in order to correct the hardening influence of salt on the meat. It also renders the bacon mellow, and increases its juiciness and flavor.

Sugar may also be classified amongst the mild antiseptics as a meat preserver.

### The Purpose of Saltpetre.

Saltpetre, also known as nitre, or potassium nitrate, is used in curing. It possesses antiseptic properties, but it is chiefly added to preserve the natural color of the flesh. When salt is used alone, the natural flesh color fades and lessens the attractiveness of the bacon. Attention must be given to the quantity used, as it has the effect of unduly toughening the meat if applied in excess. The quantity should not be more than one part to 25 parts of salt.

All ingredients used in the mixture applied for curing should be of the best quality, and thoroughly mixed.

### Flavoring Agents.

Flavoring agents of a harmless nature are frequently used, and may be selected from the following:—Cayenne pepper, white and black pepper, nutmegs, corianders, garlic, juniper berries, bay leaves, allspice, ginger, sage, cloves, cinnamon, bruised shallots, thyme, mace, marjoram, mustard.

### To Fix Color.

Immediately after cutting up and trimming, the surface of the flesh should be sprinkled over with equal parts of finely-ground salt and saltpetre. This is best effected through a muslin bag or a horse-hair sieve. Only a small layer is required. This is allowed to remain for twenty-four hours, and washed off with clean, cold water. It acts as a mordant, to fix or render permanent the natural color of the meat.

### Curing.

Curing can be conducted in several ways. It must again be urged that each operation should be conducted under rigid conditions of cleanliness in a cool, sweet atmosphere, with a temperature not exceeding 60 degrees Fahr.

### Pickling.

Numerous recipes are available for pickling bacon. The following is recommended:

| | |
|---|---|
| Clean rain water | 20 gallons. |
| Fine dairy salt | 50 lb. |
| Brown sugar | 5 lb. |
| Saltpetre | 2 lb. |
| Allspice | ½ lb. |

Dissolve the salt, sugar, and saltpetre in the water. Immerse the allspice, tied up in a calico bag. Boil for one hour, and skim off the frothy matter rising to the surface whilst boiling. Allow this solution to cool before filling the pickling vat, barrel, or tub. This is sufficient for 500 pounds of meat. The sides should be rubbed with salt for two days before being immersed in the pickle. It may be necessary to place sufficient weights on the sides to keep them immersed. The time in pickle will be determined by the size of the sides, but it is usually three weeks.

### Dry Curing.

This recipe has given good results:

| | |
|---|---|
| Fine dairy salt | 50 lb. |
| Brown sugar | 5 lb. |
| Saltpetre (finely ground) | 2 lb. |

Mix well.

For the first three or four days this mixture should be rubbed in over the flesh parts and around the bones and joints. Afterwards spread the mixture freely each day. The sides should be stacked. Alternate the method of stacking, so that the side on the top one day will be at the bottom the following day. Time required, about fourteen days, according to size of side.

Where a sweet, juicy, mild-cured bacon is required, the following may be used instead of the foregoing:

Sugar and fine dairy salt, equal parts. Mix well.

To impart a distinctive flavor, this famous French recipe is given:

| | |
|---|---|
| Fine dairy salt | 6 lb. |
| Brown sugar | 6 lb. |
| Allspice | 1 lb. |
| Mustard | 1 lb. |
| Saltpetre | 1 oz. |
| Bicarbonate of soda | 1 oz. |

Mix well.

Rub over the flesh daily for three days, and afterwards spread on each day for seventeen days, turning the sides in rotation.

### Washing.

On removal from the pickle, or at the conclusion of the dry-salting, the side must be prepared for smoking. The flesh is brushed over with a brush to remove salt, pieces of fat and flesh, and cleaned up. The side is washed in rain-water and soaked in a solution of bicarbonate of soda for twenty-four hours. The solution is made by dissolving one pound of bicarbonate of soda in 20 gallons of clean rain water. This removes excessive saltiness and makes the curing milder. Follow this by washing in clean rain water.

The meat edges and bones are trimmed again. All sharp points of bones and loose or hanging pieces of meat are removed, leaving the side neat and shapely.

Hang the side up to dry in a room, free from dust and insects, with a full current of air for several days. Then lightly rub olive oil over the skin and flesh. It is now ready for smoking.

### Smoking.

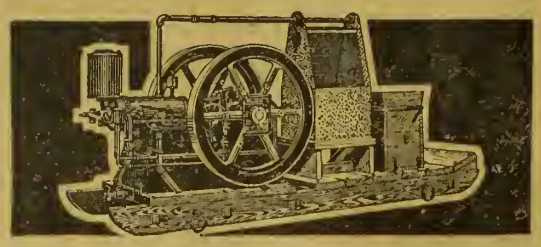
In addition to the preserving action of smoke it imparts a relishable flavor which adds to the value of the bacon.

The process of smoking preserves flesh by coagulating the albumen near the surface and forming a protective covering or envelope. It has been ascertained that in smoking bacon there is no loss of nutriment, and it is as digestible as fresh meat. The smoke creates a distinct antiseptic or preservative action apart from the dried albuminoid coating by depositing on the surface from the smoke creosote, formaldehyde, and pyroligneous or crude acetic acid. These check the action and growth of putrefactive organisms and their processes. They retard decomposition, as well as imparting a delicate and appetizing flavor.

The smoke house should be about 12 feet high, seeing the bacon must be hung from 6 to 10 feet from the floor. The floor should be earthen, brick, or cement, with a depression in the centre, away from the walls, in order to avoid setting fire to the frames. There should be no light, excepting that admitted from the door when open. Sunlight has a tendency to bleach the bacon and deprive it of its natural color.

(Continued on Page 420.)

# IRRIGATE FROM YOUR OWN RESERVOIR WITH AN I.H.C. GASOLINE ENGINE



Water is the great magician that brings life where desolation reigned—transforms the parched land of the cactus into a rural paradise; where luscious fruits, prize garden truck, plump grains and sleek stock abound; where progressive frontiersmen are carving out new empires.

A hundred thousand square miles of former wastes are now ready for the plow, simply because irrigation has brought the water which nature refused.

Irrigation is centuries old—I. H. C. irrigation is new. There was irrigation even before the pyramids were built. But the ancients knew nothing about that independent, never-failing, cheap irrigation which you need.

Don't depend upon the water-ditch that belongs to somebody else. Don't build long ditches and expensive flumes. You have the water. It may be running streams or low-lying ponds. Pump it into your own reservoir.

At times of heavy rainfalls fill your reservoir and have sufficient water through the longest dry spell. You will then have the water when you want it and where you want it.

The modern farmer must use modern methods. He must mix brains with his work; he must fertilize his soil with up-to-date ideas, and the best idea of all is that of an

## I. H. C. Gasoline Engine

This powerful little engine will pump unlimited quantities of water for you at a surprisingly small cost.

A type for every section and every problem—all sizes for all farm uses—vertical, horizontal—both stationary and portable; engines on skids; sawing, pumping and spraying outfits. Also I. H. C. gasoline tractors—first-prize-gold-medal winners—the best all-'round farm tractor by test.

An I. H. C. gasoline engine not only frees you from the worries of uncertain rainfalls and the irregularities of gravity irrigation, but the problem of the hired man is simplified—the efficiency of your other farm machines is more than doubled. It will operate your grinder, fanning mill, cream separator, churn, pump, thresher; your bean huller, cider press, alfalfa cutter, and any other machines requiring power.

Nature has given you the land and the water, the seed and the sunshine. A reservoir will cost very little to build, and an I. H. C. engine very little to own. It will save its cost before you run it a year.

Information regarding I. H. C. engines will be cheerfully given by the local agent; or, if you prefer, write to our nearest branch house for catalogue, prices and further details.

# Citrus and Sub-Tropical Fruits

## THRIPS.

BY FAR the most serious enemy of citrus trees at the present time in the arid Southwest is a species of thrips. Specimens collected by the writer at Phoenix were sent to Dr. W. E. Hinds of Auburn, Alabama, and from the limited material he tentatively identified the species as Euthrips occidentalis (Pergandi). These thrips are injurious to citrus trees only in hot, dry countries and are becoming quite serious at Hermosillo, Sonora, and in the San Joaquin Valley of California, as well as in Salt River Valley. Thrips are very minute, and keep themselves so well concealed in the growing bud that but few orchardists realize that they are the cause of a serious leaf disease. These insects infest the growing shoots of the orange. Their mouth parts are fitted both for sucking and for scraping or rasping the surface of the very tender leaves. They force their way into the terminal bud where they conceal themselves in the very small and as yet unopened leaves, which they injure seriously by sucking and rasping the tender surfaces. Later, as the shoot elongates and the mutilated leaves unfold, they are distorted, thickened, and permanently much reduced in size, with characteristic whitish markings. Affected leaves never turn yellow and fall, but on account of being so distorted and reduced in size, the twigs are not properly nourished and consequently enter the winter dormant period in a weakened condition. They often die back before spring, when a bunch of small shoots pushes out to take their place. These in turn are attacked by thrips, and the result is a ragged tree with bunchy, unhealthy foliage. Since this imperfect cover fails to afford good shade the larger limbs and trunk of the tree are soon seriously sunburned.

After a very careful survey of the trouble in Salt River Valley, it was found that all varieties are not equally susceptible to thrips injury. The Washington navel seems to be much more susceptible than any other variety observed. Valencia late is attacked to a less degree than the navel. Paper Rind St. Michael seems to be almost free from it, though the trees observed occurred in the same grove with very badly infested navels. Lemons are only slightly attacked, and pomelos seem to be practically free from the trouble. When thrips enter the blossom buds of the orange just as they are opening, they rasp and scrape the surface of the ovary in such a way as to cause injury to the tender skin. After the petals fall and the orange grows in size, the injured skin expands and permanent scars appear which, while they in no way lessen the eating qualities of the fruit, detract seriously from its looks and selling value. In some years the weather conditions during blooming time are more favorable to the thrips than in others, and hence the amount

of "rind-scar" noticed at the packing house is greater.

At present little is known about the life history of this orange thrips, and no remedial measures have as yet been marked out.—Bulletin 58 of Arizona Exp. Sta., Citrus Culture in the Arid Southwest.

### LEMON TARIFF.

The new tariff bill increases the protection on lemons fifty cents a hundred pounds. It was shown at the tariff hearing that California lemons could be sold in Chicago, because the freight charges from New York to Chicago acted like a protective tariff against foreign lemons, but that they could not be sold, and were not sold, in New York. Here was a case where the tariff protection was demonstrated by actual experiment to be insufficient, and the rates were naturally, and quite properly raised. But forthwith, the railroads proceeded to grab for themselves a half, or nearly half, of the advance. They have added 15 cents a hundred pounds to the freight rates. If the freight rates are gross, and the tariff rates net, as we suppose, then the increase in freight is nearly half of the increased tariff. That means either that the railroads propose to continue to keep California lemons out of the New York market, or else that they think an increased tariff of twenty-five or thirty cents would have been enough to open the NewYork markets. If they are correct in that judgment, of course "the traffic will bear" the other twenty or twenty-five cents for the railroads, and they proceed to take it.

But it was not to protect the railroads that this tariff was levied. Presumably they can make a profit out of the carrying trade of whatever industries are permitted to flourish in California. If it is not one it will be another, but the more industries and the more shipping they do, the better it is for the railroads as well as for the state. So the railroads will get the benefit, indirectly, of the prosperity of any protected industry. If there is profit in shipping the present output of lemons, at a cent a pound, there is more profit in shipping more lemons, at the same rate. If a tariff of twenty-five or thirty cents could have opened the remaining American territory, and thereby increased the shipments, then that was enough tariff to put on. As it is, the railroads have in effect assessed a countervailing duty, to absorb to themselves all of the increased duty above what they thought would accomplish the result. They may be mistaken. At any rate, the lemon growers have a right to protest against the increased rates.—Fresno Republican.

### ORANGES IN MEXICO.

The writer recently had the privilege of a few minutes conversation with Messrs. Ignacio E. Castellanos and Jesus Rivas, both of Guadalajara, Jalisco, Mexico. These gentlemen are making observations of conditions in California. They have large estates in Mexico and have planted extensively of the navel orange. At the time of our interview they were on their way to the picnic of the Claremont Horticultural Club at Pomona, accompanied by Jose Luz Salmon of Los Angeles acting as interpreter. Guadalajara is far removed from the district which harbors the pest called the Morales orange maggot, and Mr. Castellanos assured us that he had no concern as to its ever reaching his groves.

The rainy season in that country is the reverse of ours, that is, the rains fall principally from March to October. Irrigation, though sometimes by means of pumping plants, usually depends upon gravity flow.

## Good Implements are an Investment Not an Expense

YOU do not consider a GOOD horse an expense, because a good horse will return a profit on the investment every year—so will a good cow.

A good PLOW, a good CULTIVATOR, a good PLANTER, a good HARROW, a good WAGON or BUGGY is a GOOD INVESTMENT.

If you have an implement on your place that does not work as well as it should then that implement is an expense, because you are not making as much as you could make by using a better one.

**JOHN DEERE IMPLEMENTS**
**THE WORLD'S STANDARD**

There is no plow-share so good as a JOHN DEERE. Ask your blacksmith. The same prime material and workmanship go into all JOHN DEERE implements.

A Nebraska farmer retiring from business after advertising all his property closes his sale bill as follows:

"And now one JOHN DEERE stirring plow which has been in continuous use for 15 years—the plow that cleared the mortgage off this farm."

JOHN DEERE implements are a good investment—not an expense.

# Deciduous Fruit Culture

## JULIAN APPLE RAISERS.

SOME of the finest apples produced in California are grown in the Julian section, a mountain district of San Diego county, back some thirty-five miles from the city of San Diego. The one unfortunate feature with the section has been that its means of transportation were not at all satisfactory. Hopes are entertained, however, that the early future may see some method of getting to market its fine fruits. But little effort has been expended to make this section known to the world, but recently the Improvement Club determined to have an "Apple Day." It succeeded remarkably and the estimate is that over 500 people visited the mountain town from outside districts. Regarding the exhibits, we quote as follows from the San Diego Union:

"Fully fifty automobiles, mostly big ones, made the trip, and, considering the road difficulties faced, the auto people had lots of luck.

"The women of Julian provided dinner for any number up to 600, and the celebration committee had bought 500 big attractive Apple Day buttons to give away—visitors first. So it was evident that the calculations had been for 500 people, providing the weather behaved good.

"The supply of labels ran out before the demand was satisfied, but there was no such thing as a shortage in dinner supplies. The "free dinner" was a thing long to be remembered. Lots of tender chicken, toothsome ham, choice mutton and pies that were no relation whatever to the pie of commerce, all combined to make the "free dinner" a free banquet.

"But the thing the people came to see—the display of apples and other mountain products—was surely an eye-opener to every visitor there. Among those who looked with wonder and surprise on the room full of the choicest things the country can produce were some who had seen similar exhibits at Seattle and previous exhibitions, and Chester Gunn, well known as an apple authority, expressed the opinions of these when he said that there had been nothing shown at any of the places that could come up to Julian.

"Hundreds of boxes of apples of the qualities that more than once have beaten those of all the United States, were on exhibition, and they were surely a sight for the eye to behold.

"To show that Julian has something more than apples to depend on, there were in evidence fine assortments of grapes, pears, peaches, plums, quinces, walnuts and almonds, and, in the vegetable line, big pumpkins, melons, squashes and turnips.

"There were also on exhibition fine potatoes, corn, cabbages, cauliflowers, beets and sunflowers and even cotton. Samples of honey—another important district product—were shown and as proof that the women folks in the mountains know how to put up preserves at their best and in the old way, there were to be seen many and varied toothsome dainties in bottles and jars.

"The whole center space in the town hall was taken up by the exhibits, the front of the platform was also covered and there were tables of fruits and vegetables all around the sides. At the lower end of the hall the girls of the district had distinguished themselves by building a trellis of the choicest kinds of grapes, and showing across the face of it, made of rosy little apples, the words, "Apple Day, October 9th."

"On one side of the hall were the "help yourself" boxes, and these, like the widow's cruse of old, never seemed to empty, although the many hundreds of people helped themselves all day to delicious apples, grapes and other fruit luxuries. Outside were barrels of cider of a very palatable kind, and this was the only thing sold during the day—five cents a time for a big glass, and anyone who went there once came back again.

"The biggest showing in fruit exhibits was put up by W. L. Detrick and Rex. B. Clark, but there was hardly a ranch or orchard in all the mountain country around Julian that was not well represented. All had done well when called upon to demonstrate what the district could do.

"Taken altogether the exhibition was worth coming a long way to see and the hard-working committees who got it together—some of the men had worked every day for nearly two weeks—deserved richly all the words of praise that the visitors gave for the whole show."

The San Diego Chamber of Commerce proposed to the Julian people to continue the exhibit if they would forward it to San Diego. This was decided upon and the San Diego people were given an opportunity of seeing highly colored apples. When the railroad is built through that mountain valley, we doubt not it will be heard from more often.

## IMPORTANCE OF SELECTING BUDS AND CIONS.

The selection of buds and cions is the most important item connected with the growing of nursery stock. What does it matter how large and strong, healthy and symmetrical a tree is if it is a poor strain of the variety. That there are excellent. good and poor strains of any established variety of fruit, it requires only fairly good eyesight to prove while passing through an orchard. Some trees are heavy and quite regular bearers of fine, large, highly colored fruit, while others are indifferent bearers of small light colored fruit. Since in nature the tendency is for the progeny to resemble its parent, it is only good common sense to follow the practice of taking buds and cions from trees known to be superior types of the variety. Thus a choice strain of the variety may be secured. Such a strain is often called "pedigree" stock, and it may or may not merit the name.

Fruit growers should understand the advantage of procuring trees thus propagated, and also understand that it entails added expense to the nurseryman to produce such trees and he must necessarily receive a higher price for them than for ordinary trees. The fruit grower should willingly pay the extra price, knowing that it is the best investment he can possibly make in nursery stock.

# Scalefoe

Greatest Known Spray or Wash for Scale: San Jose, Black, Red, Purple and Brown. Also a sure thing for Red Spider, Canker Worm, Moss, Gum Disease, Silver Mites, Mealy Bug, Caterpillars, Lice, Codling Moth, and all Insects and Bugs that infest plant life; without injury to the plants, and with positive benefit to the soil, when applied.

This has long been the leading Spray or Wash in many sections of the country, wherever introduced. We have bought the formula and the rights for this section and are putting it out under our own brand. No article can bear the "West Coast" name unless it is the best of its kind. We guarantee Scalefoe to be just as represented. Send for circular with many testimonials.

Gallon can, 85 cents; 5 gallon can, $3.75. If not sold by your dealer will send gallon can for $1 or 5 gallon can for $4, freight prepaid by us within 200 miles. Write for price in barrels. Mix 20 parts water to 1 part Scalefoe, before using; makes it the cheapest as well as the best. Satisfaction or money back.

PETER BACIGALUPI & SONS, Phonographs & Pianos

941 Market Street, . . . San Francisco

Since it is entirely impossible for the nurseryman to obtain enough buds and cions for his purpose from desirable bearing trees every year, the practice of using buds and clons from nursery trees of selected strains must neccssarily be followed for a year or two at a time, but this should be done as little as possible and bearing trees should be depended on for budding and grafting wood every second year.

The old practice of propagating year after year from nursery trees is unsatisfactory and unreliable and should be condemned. Nurserymen often continue propagating varieties for years in this way without ever seeing the fruit and do not know whether or not they have the variety true to name. As soon as the fruit growers demand better bred stock and are willing to pay for it, the old practice is doomed and the sooner this occurs the better it will be for the industry of fruit growing.

The best method of all for the fruit grower if he depends upon purchasing his trees, is for him to select the budding and grafting wood, send it to the nurseryman, and employ the nurseryman to propagate the trees. Thus the fruit grower does the best possible thing for himself and for the fruit growing industry.—From Bul. 130 of Maryland Exp. Sta.

### HOW NOT TO PLANT TREES.

Some interesting experiments have been made at Woburn Farm and other places in England to demonstrate the proper way to set trees.

Most of us have been planting trees in the same way since tree planting was begun. First, a large hole was made, the roots carefully spread out in all directions, the soil filled in by hand in a way to keep the roots in as nearly their original position as possible, the hole filled a litte more than level and then trodden down.

According to the reports from England this is all wrong. The proper way is to make a small hole, double the roots up any old way, jam the tree in, ram down the soil as hard as if one were setting a fence post.

The results of the English experiments show that 59 per cent of the trees planted in this way showed in favor of ramming, 27 per cent showed no difference at all and nearly 14 per cent were against the fence post method.

Trees that were rammed down showed a copious development of fibrous roots.

Experiments further show that the fibrous and small roots produced in the nursey before digging play no great part as roots during the subsequent life of the tree.

### NEW BORDEAUX MIXTURE.

A Bordeaux mixture that is said to be superior to and cheaper than that made according to the commonly accepted formulas is recommended by the Woburn Experimental Fruit Farm, England. The new Bordeaux mixture is made by slaking three pounds of quick lime in about 100 gallons of water and then adding 86 gallons of this clear solution to 14 gallons of water in which six pounds, six and one-half ounces of copper sulphate has been dissolved. This will yield 100 gallons of a clear Bordeaux mixture.

A farmers institute will be held at Turlock November 8 and 9.

## Stewart No. 1 Ball Bearing Horse Clipping Machine

It's an economy for the man who owns one or more horses. For, with a STEWART, there are no delays. The machine is always ready for use. Horses can be clipped more frequently and at Regular Intervals. The STEWART is *the* machine that lasts indefinitely and gives good service *all* the time. It never requires attention, and runs practically without friction or wear. A tremendous speed of the knives is obtained by slowly turning the handle—and a boy can turn the handle. (Another boy can clip the horse.)

**Complete for $8.50.**

The price is for the machine ready to begin clipping horses with. It includes six feet of flexible shaft, the famous Stewart Clipping Knife and a liberal guarantee. Get one at your dealer's. If not there, write us.

## TRICKS.

By Mrs. M. E. Sherman.

MANY of the tricks and vices of the ordinary domestic animals seem to be inherited. If they are not inherited they arise from a condition that is inherited. The cow that kicks has often a daughter that kicks. This may be from some stricture of the udder that is inherited, that makes the milking painful. It may be a kink in the cow's brain that is inherited and under certain conditions the action is transmitted to the hind leg. The milker sprawls on the ground and the milk is spilled. This trick is undesirable and when a cow persists in kicking send her to the butcher. Her own profits are eaten up by the habit of mind the man having to milk a cow like this acquires. It is hardly possible to be gentle and kind after a cow has kicked you over. That cow knows you do not like her and she goes from bad to worse. Get rid of her and keep the milker sweet.

### Self Sucking.

This vice is said to come to cows that are staked and lack water to drink. If this is so they are to be pitied. Yet we do not keep a cow out of sympathy for her afflictions but to give us milk. If the cow takes the milk herself it is merely a case of a circle within a circle with nothing left for the outsider. The first case we ever owned was a common red cow that came with a ranch we purchased. When her depravity was detected she was let run along until she freshened with twin heifers. She was sent to the butcher and the twins were raised with the other calves. One was all right; the other, after her second calf was dropped, took to self milking. She was promptly sent to the shambles. Her daughter proved to be a self milker and the daughter of her sister also started in to the same practice. These three were beefed and it left only the one of the twins. This twin had six heifer calves. Three were self milkers. I concluded I would beef them all and not be troubled with this cropping out. I have not had the trouble since. In all I handled eleven of these self suckers, all ten the descendants of this one old red cow.

### Prevention.

The prevention of this vice is not easy, for it is apt to interfere with the cow's way of eating, sleeping and licking herself clean. The first device used was a hollow bit. This was soon discarded as the cow could not eat well nor chew her cud. She lost flesh rapidly. The next thing used was the common bull ring in the nose, with two smaller bull rings hung on it loosely. This proved no good as the cow managed to tangle up the hay on it and it interfered with the grazing. The only way to keep the cows fat was to feed them heavily in the barn with grain, and this did not pay. Five of these devices were in use and three of the bits, and they were used on more than one cow so that in condemning them we felt we were justified. After the experience we had, the neighbors came to borrow these instruments of torture. One cow killed herself by choking on the bit; another tore off a teat with the rings. Whatever is used on a cow, we must remember she is one of the most awkward of animals as well as the most persistent. She must be guarded from injury.

### Staves.

The next thing tried was a corslet of barrel staves around Bossy's neck. These staves were taken from a small barrel and had a short staple driven in near each end on the upper side. The square corners were rounded off and then a heavy maleable iron wire was passed through the staples. The whole affair was carefully fitted and then the staples were driven home on the wire and carefully clinched on the underside. The ends of the wire were turned into rings and a hame strap used to buckle the affair around the neck. This worked on all except one cow and she learned to get half over on her back and twist over so that she could get to half her udder. She caught herself when down one day and nearly died before released. A self milking cow is nearly always on one's mind. You wonder how she is each morning, whether dead or alive. The common device of putting a seatless chair over the cow's head I notice on a cow between here and town, but modern chairs are not put together with strength enough to make this arrangement lasting. This same cow had another cow put in the corral with her and was nursing her the other day. Evidently she is a milk lover.

### Another Plan.

The foreigners here split the cow's tongue to prevent self milking. This is good in that it stops the habit, but it is bad because in many instances the cow loses the power of rolling over the cud. I have seen an arrangement of two sticks with a surcingle. The two sticks came up on each side of the cow's shoulders and were fastened to the cheek straps of the halter. The other ends of the sticks were secured to a surcingle around the cow's body. These work well enough in most cases and are a modification of the usual plan. The standard form seems to be the halter on the head with the surcingle around the body with the broom stick swinging between the front legs. The end of the stick at the halter is given enough swing on a short strap not to bind on the breast. In some cases it is necessary to give as much play at the other end. This, however, must be regulated by the individual to fit the cow. None of these devices are perfect; none of them will overcome the difficulty absolutely. There are some cows that will find a way to get the milk no matter what happens. The way out of the trouble is not to keep the cow but send her to the butcher as quickly as possible. I know where there is only one cow and she is bought cheap because of

this vice, people will keep her. They should, however, be willing to let the cow beat them sometimes if it is all considered in a day's work. The trouble is that we Americans do not take the foreigner's view of things. An old Swede living down the road a little piece, has a self milking cow. He was standing looking at her and said to me: "She is mean to take her milk. I am mean to put that ring with nails in it around her nose and that stick between her legs. Two mean things together, each trying to beat the other. Well, we will not worry about it for when she gets meaner than I am, I can have her head cut off and still get thirty dollars out of her." I thought he was right. Why worry when he was master at least of the cow's fate?—M. E. Sherman.

## TREATING THE OVERHEATED HORSE.

When during hot weather the hard-worked horse suddenly stops sweating, lags, weakens, pants, and has hot, dry skin and extremely reddened membranes of the eyes, nose and mouth, he is suffering from heat exhaustion, and by using the thermometer it would be found that his temperature is over 106 degrees.

Unless a horse in this condition is immediately rested, put in a cool, shady, breezy place and there cooled off, he will be likely to fall and quickly die of heat apoplexy or "sunstroke."

It therefore is well to know and look out for the symptoms here outlined and then be able to treat them intelligently.

In the first place it is important to remember that heat exhaustion may be largely prevented:

By keeping the horse's stable clean, airy, perfectly ventilated, darkened and screened in summer time.

Feeding the best of foods in adequate but not extreme quantities.

Making no sudden changes of food.

Allowing plenty of cool, pure drinking water.

Permitting ample time for rest at noon.

Removing the harness during such rest periods.

Not overworking any horse and always changing frequently the middle horse of a three-horse team, as he suffers fearfully from the direct rays of the sun.

Also shade the polls of horses at work and in such a way that air can pass under the shading hat, shade or other cover.

Clip the horse if his coat is long and coarse at the commencement of summer work and protect the skin by a light, open meshed sheet—white.

When a horse shows symptoms of heat exhaustion, stop work, stand him under a tree where there is a breeze, shower his body with cold water from a sprinkling can, keep cold wet packs to the poll of his head and give him large, frequent doses of stimulants such as whisky in strong cold coffee.

Do not bleed him or give him aconite or other poisonous drugs. Repeat the dose of stimulant every half hour at first and every hour or two as he gains strength and the fever abates.

A good stimulant is prepared by mixing together one part of aromatic spirits of ammonia and two parts each of alcohol and sweet spirits of nitre.

Of this give two ounces in a pint of water or cold coffee as one dose.

Dissolve an ounce of saltpetre in half a pailful of water and allow him to drink a little of it often.

If he is bloated give four ounces of hyposulphite of soda dissolved in water and inject soapy cold water and glycerine into the rectum once an hour until relieved. In case of sunstroke call in the graduate veterinarian as soon as possible.—Ex.

## NORMAL FEEDING RATIONS FOR DAIRY COWS.

The average amount of dry matter eaten daily by a cow weighing 850 pounds and in full milk, will be about 25 pounds. Some animals require more and some less; consequently study of the individual animals will determine the exact amounts to feed, but the following are average rations for the ordinary cow, being fed for milk and butter, mixing by weight (not measure):

Two portions cottonseed meal, three portions corn meal, three portions wheat bran, 15 portions grass, hay, clover or fodder.

Or two portions cottonseed meal, six portions corn meal, eight portions good hay, corn fodder or clover, eight portions cowpea vines.

Or forty portions ensilage, seven portions common hay, seven portions shorts, three portions cottonseed meal.

Or sixteen portions clover hay, six portions corn meal, six portions bran or shipstuff, four portions cottonseed meal.

Or six portions clover hay, six portions corn stalk, cut and shredded, six portions cob meal, two and one-half portions cottonseed meal, forty portions ensilage, six portions corn meal, three portions cottonseed meal.

Or as recommended by Connecticut Experiment Station, twelve and one-half pounds hay, five pounds corn meal, five pounds wheat bran, two pounds of cottonseed meal.

NOTE.—By reading all of the above as "pounds" instead of "portions," you will get an average daily ration per cow.—Holstein-Friesian Register.

## HINTS ON PIG REARING.

Do not make the food too sloppy.

Keep plenty of charcoal in pen.

Put a packet of Epsom salts in the food occasionally.

Castrate pigs at three weeks, not later.

Observe regularity in feeding, and let them out for a run occasionally.

---

It is especially important that alfalfa intended to be fed to hogs should be cut early. An experiment at the Kansas station showed that a ton of early cut and well-cured alfalfa hay fed with grain, produced 868 pounds of pork, while a ton late cut and poorly cured, fed with grain, produced only 333 pounds. For fattening hogs it is well to feed about one ton of well-cured alfalfa hay with each 250 bushels of grain.—From Coburn's "Swine in America."

---

The Patterson Ranch Co. at Modesto is preparing to irrigate 20,000 acres of land on the West side.

---

Five hundred tons of hay were destroyed by fire recently at Turlock.

### THE TOAD.

IN your paper of Sept. 23, you have an article on the toad. I endorse all you say about its protection, for it is a very useful and interesting little animal.

Let me tell you some of the things I know about him. When I was a boy I was told if I hurt a toad, the first time I went barefoot I would stub my toe so hard it would hurt, as I did not want to be hurt, I did not hurt the toad. As I grew older and found how useful he was I had another reason for not hurting him.

I came to Pasadena to live some years ago and having friends in Alhambra would occasionally drive over. As I was born with a good pair of eyes, I use them, as I go through the world, I look around and and notice things.

While driving a few years ago in early spring, perhaps February or March I noticed a reservoir full of water by the side of the road; as there was no wind the surface of the water was as smooth as glass. I drove on a little farther and came to another reservoir. The water in this one was rippled all over, quite rough. I thought it strange as it was still calm and I must see about it. Before I got to the bank I saw some toads! going up the bank, I saw some more toads! on the top of the bank still more toads! over the bank more yet and the water was just full of toads, thousands of them. There were large toads and small grey toads and dark colored toads and toads with tails which looked like a cord made of jelly enclosing a string of black beads. Some of them were sitting on the bank, some were swimming and some big fat ones crawling on the bottom. They all seemed to be having a good time, a sort of family gathering. Well I looked at them and then drove on.

Two or three weeks after I was driving over the same road and thought I would take a look at the toads, and lo, there were none there, a few dead bodies floating about, but no live ones. Instead there were millions of black tadpoles, the bottom was completely covered for eight or ten feet from the shore and in the middle of the pond several square rods covered with them. This told the object of this meeting. We know that fish will go to the place where they were hatched to deposit their spawn and from this I should think that California toads had the same habit.

At the East we find them in every puddle. I do not see many toads here and so think some must make a long journey together. Toads are not noted for their speed; when you send a boy on an errand, to say he goes as fast as you can whip a toad doesn't mean he will be back very soon, so I think some of these toads must spend a large part of their lives going and coming from the breeding pond.—L., Pasadena.

### INVESTIGATING CELERY BLIGHT.

Notwithstanding the extended and most excellent work done by Prof. Ralph E. Smith with the celery blight, he is now directing another line of work in the fields of Orange county. His assistant in immediate charge of the field work is Mr. S. S. Rogers formerly connected with the Spreckels Beet Sugar Experiment Station. Mr. Rogers has been in the field a couple of months and probably will stay through the entire season, making observations as to the blight and the conditions which most favor its growth, also making experiments with various fungicides.

### SOUTHERN GARDENER'S PRACTICAL MANUAL.

We have before us a copy of the Southern Gardener's Practical Manual written by Mr. J. S. Newman and sold by the Orange, Judd Co. of New York for one dollar. It is a valuable little book of 220 pages and comes nearer to striking California conditions than most eastern gardening publications. Of course it is not written with a view to arid locations, but at the same time it contains points helpful to the California gardener. It treats of soils, classification and manner of formation, composition of plants, methods of fertilizing and sources of fertilizer, but the main body of the book is given up to practical gardening methods, rotation of crops, intensive gardening, forcing early vegetables, garden tools, mulching, different varieties of vegetables and small fruits, etc. The calendar for spraying and planting contains some helpful suggestions, though largely applicable to eastern conditions. In the preface the author says:

"Believing that a more abundant and continuous supply of tender, fresh vegetables and luscious fruits upon the tables in our southern homes, replacing to some extent the deadly frying pan and the omnipresent canned goods, will contribute to health, refinement and intellectuality, I feel that my declining years can, in no other way, be more appropriately spent than in an earnest, honest effort to render our farm homes more attractive and their occupants more healthy and happy.

The true gardener loves his plants as living companions, and enjoys their successful growth as he does the happiness and prosperity of his children. Plants respond to kind, intelligent treatment, and manifest their gratitude by supplying more abundantly and perfectly their treasure of flowers and fruits. The fragrant rose greets with blushing pride the coming of its kindly benefactor, and seems to delight in his affectionate admiration. There can be no contamination from association with plants, and no danger of deadly disease germs in the consumption of their products."

In starting vegetables or flowers in the house it is a good plan to cover the boxes with wet blotting paper or wet newspapers until the plants begin to appear, to prevent the top soil drying out. A crust is not so likely to form over the top of the dirt at any later time if the boxes or cans are set in a pan of tepid water until the moisture is drawn up to the top by capillary attraction, instead of pouring water over the surface.

# The Ornamental Garden

## THE CUT-FLOWER INDUSTRY.

THE following advice applies to roses only, and is based on the experience of one establishment consisting of thirty-seven greenhouses. These houses are built in two "ranges," one range being heated with steam, the other with hot water, each range having its own heating plant and crosshouse. The individual houses vary in width from thirteen feet to twenty-three feet four inches, and are one hundred and fifty feet long. Cut roses are the only product, each house being devoted to one variety of rose. Two small houses, ten by one hundred and fifty feet, are used for propagating and for housing the young plants.

In choosing a locality in which to establish a business for forcing plants for cut-flowers, three very important items are to be considered: first, economy in obtaining fuel; second, nearness to a good and sufficient market; third, suitable soil.

### Glass Houses.

The successful forcing of roses depends very largely on an abundance of light: hence, the question of light and shade must be considered in choosing the site. The ranges described have their cross-houses, running due north and south, with the greenhouses proper running east and west. The idea is to so place the houses that the rays of light will fall as perpendicularly as possible on the glass. It has been suggested that a better method would be to deflect the whole range a little to the west, thus getting more sunlight during the short winter days. The houses should be sufficiently far apart that the ridge of one house may cast no shadow on the one immediately behind. The same consideration must be given to other buildings in the neighborhood, also to the proximity of factories or railroads using bituminous coal, as the smoke from this coal cuts off a large share of sunlight and makes a greasy, obscuring deposit on the glass.—From Cyclopedia of American Agriculture. Reproduced by permission of The Macmillan Company, New York.

## EUCALYPTUS FICIFOLIA.

The specific name of this variety of the genera, of the order Myrtaceoe, to which the sweet-scented myrtle belongs, signifies fig-leaved. Why it should be thus designated is difficult to understand, since the foliage of both subjects are wholly unlike, i. e., the tree commonly known as the fig. To be sure, rubber trees belong to the same family, the foliage of some of the members being much like that of the eucalypt under discussion. Nevertheless, we believe the name to be misleading, therefore inappropriate.

This part of the history of this, the most beautiful when in bloom of all eucalypti cultivated in Southern California, is not the one we wish to discuss. It is its value as an ornamental plant that we desire to call attention to at this time. When in bloom, for gorgeous coloring it is unsurpassed. The plants growing hereabouts vary in habit of growth and in precocity of bloom. In 1908 we planted two trees in the open from gallon cans. They were about the thickness of a lead pencil and four feet high. This season the one bloomed profusely, while the other did not have a bud on it. The flowers were very beautiful, though not of the intense scarlet color that characterizes the true type; moreover, it bloomed during July.

The thought suggested by the plant in question is that, for a decorative house plant, if tub grown and encouraged to throw out branches from base to summit, when in bloom it would have no equal, and when not in flower, equal to any other evergreen plant in appearance. To perpetuate the variety it will be necessary to propagate it by cutings or budding. Here is a suggestion for our progressive nurseymen who care to excel in fine stock and give to those parts of the world the most beautiful of all ornamental plants when in bloom, where climatic conditions are such as are found in Southern California.—Pacific Garden.

## THE HOME GROUNDS.

There is much room for improvement in arranging buildings, and planting trees and shrubs on the grounds about the farmhouse. A lack of division between the farm home grounds and the barn yards is one of the chief causes of lack of attractiveness about so many farm houses. If buildings are already in place, it is possible in most instances to locate the hog yard, calf pens and poultry yards at a point most remote from the house. Then put a street three or four rods wide between the house and the barn and plant shrubs or low growing trees along border of street next to barns. In time a permanent screen will be provided that will shut out any objectionable view from the house.

Where grounds are being laid out a good arrangement is to have the home lot on one side of the public highway and the barnyards and business side of the farm on the other, not directly in front of each other, have a slope if possible from house toward barns.

This is a good time to use paint liberally. Remember that a well kept country home means from $5 to $10 more per acre when it comes to the selling time. More home beauty, brethren, means a more contented and happy family. Think on these things now.—Successful Farming.

---

There are 200 species of roses in existence, though perhaps not more than 50 clearly defined families. Of these two are of American birth. There are thousands of varieties, however, and of these our enterprising rose growers have contributed by far the largest proportion. The eagerly sought black rose is still unproduced, though a New York florist has a dark-red one which in some lights had the appearance of black velvet.

---

Keep all blossoms cut as soon as they wither, and do not allow seeds to form—unless you really want seeds.

**Burr Clover** The best cover crop. We can offer it at a reasonable figure. Write to us for prices on this and other green manuring crops.

Get Our Prices on New Crop ALFALFA SEED.

**Onion** White Bermuda, Red Bermuda, Crystal Wax, New Queen. Now is the time to plant early onions in the Great Inland Valleys of Southern California. And we would especially call your attention to our line of imported onion seed. They are all True to Name and "Full of Life." Get our prices on large quantities.

**Sweet Peas** Plant the early varieties now for flowers this fall. The following varieties bloom in 50 to 60 days from planting. 10c per packet, 3 packets for 25c. ***Morris & Snow's Earliest Pure White*** (Gould). ***Earliest of All,*** pink and white, very early. ***Bodger's Earliest Pink,*** New. Proved a great success last year. As early as the Earliest Pure White. (We control this stock.) ***Mount Blanc,*** pure white.

PRODUCE MARKET.—Los Angeles Markets; San Francisco Markets; Citrus Markets, 430, 431.

## Farm Census.

THE Bureau of the Census is giving out information as to the line which will be taken next year. There is to be a special effort to get complete agricultural returns, and the bureau asserts that these will be classified so as to be of greater value to the country than has any past census. The census of 1900 showed that the United States was still primarily an agricultural country. The total farm value on June 1st, 1900 was about twenty and a half billion dollars, more than twice the capital invested in manufactures. Seven million farmers are conducting agricultural operations on separate farms.

The farm census is taken primarily for the benefit of the farmer, and upon the accuracy of the information given the enumerator by the farmer next April depends to a large extent the value of the statistical work to be carried on in the farmer's behalf during the next five years, not only by the federal and state departments of agriculture, but by students of agricultural conditions in all parts of the world. To what extent the very marked increase during recent years in the cost of living, and especially in the cost of certain kinds of farm produce, is due to shortage in production, is a question of vital moment to a vast number of people. A complete and accurate census of farm areas, products, and values will furnish data which, studied in connection with the revised population figures, should throw much light on the great question of our national food supply. The farmer and the urban consumer alike desire information along these lines. It lies with the farmer to provide it.

The scope of the farm census takes in the following:

"The schedules relating to agriculture shall include name, color, and country of birth, of occupant of each farm; tenure, acreage of farm, acreage of woodland and character of timber thereon; value of farm and improvements; value of farm implements; number and value of live stock on farms and ranges; number and value of domestic animals not on farms and ranges; and the acreage of crops planted and to be planted during the year of enumeration, and the acreage of crops and the quantity and value of crops and other farm products for the year ending December thirty-first next preceding the enumeration.

In accordance with this act the Director of the Census, after calling into conference the proper officials of the United States Department of Agriculture, and also leading authorities on agriculture from all sections of the country, sought and received many valuable suggestions from practical farmers regarding the specific questions to be asked. The schedule adopted is both simple and complete. Every question asked calls for information that is of genuine interest to all farmers.

The schedule may be divided into five parts, as follows:

1. Personal information regarding the farmer.
2. General information regarding farm acreage, values, and expenses.
3. A statement of the acreage, yield, and value of farm crops harvested in 1909, and of all animal products—that is, dairy products, eggs, live stock sold, etc.
4. An inventory of all live stock, including poultry and bees, on hand April 15, 1910.
5. Miscellaneous information.

Under miscellaneous farm expenses and values are included amounts paid for fertilizers, crops and animal products, and these are further divided into fruits, nuts, vegetables, fruit and forest products, etc. Farmers are requested to begin keeping of memoranda and data that they may answer such questions as the enumerators may ask.

## Institutes for Women.

"AN IMPORTANT PROBLEM in education in the United States is that of reaching country women with information suited to their needs." These are the opening words of Circular 85, Office of Experiment Stations, on "Farmers Institutes for Women." The bulletin touches upon the need of more extended knowledge of domestic duties, relations of women to rural schools, education adapted to women, and refers to the fact that of the 37,244,145 women and girls in this country in 1900, about thirty-five per cent, or over 13,000,000 lived in rural districts. Many of these reside in sections where only the most limited facilities for education are provided, and are in need of every possible uplift. This it is hoped may inspire providing institutes for them, not only local institutes but a county organization made up of small bodies. A form of constitution is given in the booklet, as is also one for a state organization.

It is stated that Illinois voluntarily aids in supporting women's institutes. In fact, these institutes have already been held in half the states of the Union. California is behind in this, never having held such an institute and having as yet made no preparations for the future.

## State School Law.

WE have received from Edward Hyatt, Superintendent of Public Instruction for this state, a copy of the school law of California. This is materially different from former issues in that the last legislature made more than fifty changes and additions to the school law. One hundred and fifty bills relating to education were introduced, but of course most of these failed of passage. The present revision is issued in a 20,000 copy edition and is distributed through the county superintendents.

One feature worthy of notice is the new law authorizing supervision of health and development of children in the schools, already taken advantage of by Berkeley, Oakland, and Los Angeles. We believe this and other changes should be studied by those in charge of rural districts. A provision of particular interest to rural communities authorizes transportation of pupils living at a distance from the central school of the district. The act establishing a new state normal school at Santa Barbara is also given.

## Yuma Indian Reservation.

THE Interior Department has announced through the General Land Office that the Yuma Indian Reservation will be thrown open for entry, registration to begin on January 5th at Yuma. The unit allowed each settler will be forty acres, and after reservations have been made for the Indians, there will be 9,400 acres for the white settlers. The Indian allottment has been increased from the five acres first announced, and now each member of the tribe will receive his ten acres as was urged by many friends of the Indians. At the same time, the public lands under the Roosevelt dam will be thrown open for registration and allotments made. In this body of land there are 148,000 acres. The drawing on both of these projects will be in Yuma on February 6th.

POTATOES are in very favorable condition as compared with the past ten years. If 100 represents the average production for the ten years, this year's production would be represented by 103.8; wheat by 115.5. Our wheat crop will be one of the biggest ever this year.

## The Curing of Hams and Bacon.

(Continued from Page 411.)

What ventilation is provided, and some is needed, it should be under control. The aim is to surround the bacon with a dense atmosphere of smoke at a low temperature.

Many methods of creating a proper class of smoke are applicable. White pine, oak, cedar, or hardwood sawdust, with damp corncobs and a few green eucalyptus leaves will answer from which to kindle a fire with a good development of smoke without much heat; or sprinkle essence of smoke (pyroligneous acid or crude acetic acid) over the smouldering sawdust.

In case of direct heat reaching the bacon hanging over the fire, this can be avoided by having a sheet of galvanized iron placed a few feet over the fire, supported on loose bricks. The smoke must be conveyed to the bacon as cool as it can be. To do this, care must be exercised in preventing direct heat reaching the bacon.

In deciding the length of time to apply smoke, judgment must be used. The desirable color is a light brown tan. To obtain this, smoking may occupy any period from thirty-six hours to five days. The character of the flesh, its thickness, and other characteristics must be estimated in order to obtain perfection in determining the color and flavor imparted by smoking.

Finish the sides now by dressing and rubbing the skin and flesh with pure olive oil. Smoked bacon will hang well in the smoke-house until required, provided reasonable care be taken to exclude insects and keep the smoke-house dark, dry, and cool. Any degree of dampness or moisture in the atmosphere in which the bacon hangs will end in mouldy bacon.

Where it is proposed to pack the bacon or ham in order to preserve it against attacks from insects or other troubles, the flesh is rolled in bran, oatmeal, shelled oats, or pea-meal, wrapped in newspapers, and stowed away on shelves or in boxes.

Every effort should be made to prevent blowflies and other pests getting access to the surface of the meat. They leave eggs on the flesh and in its numerous interstices; later on these give endless trouble. A simple means of checking their depredations is to sprinkle the surface of the meat with black pepper or a mixture containing this and cayenne pepper.

Another effective plan is to saturate clean bagging, in a creamy mixture of lime and water, and wrap the ham or bacon previously rolled in oat or pea-meal. Stitch the covering closely round the flesh.

# Agricultural News Notes of the Pacific Coast

## Northern California

Tehama county is shipping its mohair clip.

Capay Valley, Yolo county, is shipping almonds.

The Santa Rosa cannery is now running on tomatoes.

Santa Rosa prune shippers are forwarding prunes to Germany.

Placerville held a most interesting farmers institute last week.

With hops still increasing in price, Santa Rosa hop growers are greatly elated.

Nevada county will ask the government to send expert engineers to plan a road system.

A successful test of eight cars of fruit was recently made at the Roseville pre-cooling plant.

Colusa county contemplates a half million dollar bonding scheme in the interests of good roads.

Cloverdale's fall wool sale resulted in the sale of 300 bales at 16 cents. The fall clip is said to be exceptionally heavy.

Directors of Levee District No. 1 in Sutter County have awarded a contract for repairing and improving the Tule levee.

The beans of Sutter and Yuba counties are reported in good condition and not injured by the recent storm. Prunes escaped, having been mostly harvested.

El Dorado county claims to have supplied to the governor of Chihuahua the fruits served at the banquet tendered President Taft at the Mexican line.

Over a million and a half feet of fine lumber was destroyed in Siskiyou county by fire last week. The flames were finally subdued by a heavy shower.

The injury to the sugar beet crop from the rains was not so great as anticipated. While it started some growth, the loss of sugar content is not perceptible.

The fruit growers' meeting which was to be held on the 20th at Penryn, Placer county, was postponed owing to the Portola Festival and will be held this week instead.

A Lodi grape grower in looking through the East has learned that Eastern commission men are using Lodi grapes to slaughter prices and war on their competitors.

The directors of the Butte County Citrus Association met recently and completed arrangements for the shipping of Butte County oranges. The season will be a little earlier than last year.

Representatives of the Cloverdale Citrus Fair Association are already visiting surrounding towns to create interest in the coming show. A new building is to be constructed for this year's exhibition.

Delta, Shasta county, recently endured a plague of hogs. They were shipped there to be driven to the acorn section for pasture, but before being driven out occupied nearly the whole town to the discomfort of residents.

## Central California

There are 342,000 acres of forest reserve in Monterey county.

The Modesto Turlock irrigation district covers 126,210 acres of fertile soil.

The prune market is improving very slowly and the outlook is not so discouraging as earlier.

Good Newtown pippins are now topping the market in London, two carloads having sold at $2.40.

The soil survey plans a survey of some of the lands of the San Joaquin Valley during the next few months.

Oranges are coloring well in the Tulare county citrus orchards, much of the fruit showing exceptional size.

An effort is being made to secure reservoir sites to insure water supply for the great Modesto-Turlock irrigation district.

A. Sustrich has grown a 30-pound sweet potato to which the Porterville Chamber of Commerce is proud to call attention.

A grape grower near Sanger, Fresno county, harvested over four tons of raisins from three acres of Muscat of Alexandra.

A land scheme has been launched in eastern Fresno county by which much foothill land will be brought under irrigation.

The red spider which has been discovered in Tulare county seedbeds is believed to have been introduced with seed shipped from Florida.

The prune market is looking better than for some time and two and three-quarters cents is usually required before the producer will let go.

The Monterey County Chamber of Commerce is promoting a movement to dispense with Japanese labor and endeavor to secure white labor to take their places.

Watsonville apple growers are talking up the holding of an apple carnival. Some think it too late for this season as the building of an exhibit hall is necessary.

It is reported that some of the raisin growers who had stock damaged by the recent rains have planned to mix good and bad raisins so as to dispose of the poor goods.

An effort is being made to establish a county experiment station in connection with the Bishop, Inyo county, High School. This high school has an agricultural science department under direction of Walter F. Sutherst, P.H.D., F.I.C.

R. L. Adams, connected with the sugar beet experiment station at Sprekels, reports that he has discovered the cause of beet blight to be Eutellix tenella, an insect an eighth of an inch in length and classified as a leaf hopper.

The statement in our news notes last week that Porterville has just received its first spraying outfit we are now informed is incorrect, the order for the outfit having been countermanded. Porterville is proud of the fact that spraying of orange trees is not necessary in that district.

## Southern California

Grain fields are already green in the Imperial Valley.

An effort is being made to establish a fuel alcohol factory in the Imperial Valley.

Great numbers of cattle are now being shipped into the Imperial Valley for pasturage.

Riverside Y.M.C.A. is repeating its last winter's course of lectures along horticultural lines.

The new cotton gin in the Imperial Valley started on October 19th. It was the occasion of a celebration.

The Fullerton-Pacentia orange district will ship the next season probably twenty-five per cent less than last year's output.

Lemon growers at Cucamonga, San Bernardino county, plan for a fine equipment in a lemon house now building.

The first full car of celery was shipped from Santa Ana through the California Vegetable Union on October 16th. Regular shipments will begin on November 1st.

Fruit growers in many sections of the southern part of the state are using their utmost endeavors to prevent the appointment of "political" horticultural commissioners.

The stand taken by the lima bean men has resulted in a very satisfactory strengthening of the market and an advance of five cents. The growers are now receiving $3.80.

Engineers are now at work running surveys for two pipe lines and locating reservoirs which will supply water to the rich section of the Yucaipe Valley in San Bernardino county.

One of the tricks which the lima bean growers maintain that the buyers have been responsible for was the shipping of dirty and damaged beans in the effort to depress the market.

At the second annual meeting of the Tustin Lemon Association the following officers were elected: C. E. Utt, president; B. H. Sharpless, vice-president; E. E. Wilson, secretary.

The Los Angeles Florists and Nurserymen's Association will hold a meeting on November 9th at which there will be a special discussion on varieties of eucalyptus adapted to California.

The examination held to determine as to qualifications of applicants for county horticultural commissioner, resulted in the passing of five names up to the board of supervisors of Los Angeles county.

The annual meeting of the stockholders of Orange Heights Fruit Exchange of Corona elected the following directors: R. D. Lamson, W. C. Barth, A. R. Whitmore, I. M. Moore, W. Sargent, L. A. Fink and F. F. Thompson. M. Morgan is retained as manager.

The directors and officers recently elected by the Queen Colony Fruit Exchange are as follows: W. H. Jameson, president; S. B. Hampton, vice-president; John P. Key, secretary and manager; First National bank, treasurer; A. F. Call, Frank Scoville and M. Morgan.

## The Coast

Oregon hops have been commanding in Portland 28 cents.

A great many Americans are again flocking to the Canadian homestead lands.

Toppenish, Washington, shipped 400 cars of hay during the month of August.

The heaviest yield of potatoes in years is reported from Spokane, Washington.

Six thousand seven hundred head of stock pass through the Union Stock yards at Portland weekly.

Over 100,000 sacks of grain were sold at Pendleton, Oregon, on one Saturday afternoon recently.

Fruit growers at Lakeview, Oregon, are losing much of their fruit because of lack of fruit jars.

5000 acres will be irrigated at Billings, Montana, from a reservoir supplied from a pumping station.

A magnificent display of apples was made at the county fair at Grant's Pass, Oregon, held last week.

A big power plant will be erected on the Snake River, Washington, and over 20,000 acres of land will be irrigated.

Two prune packing plants at Vancouver, Washington, are employing 300 hands in preparing the output for shipment.

Surveyors are segregating land under Crane Creek Ditch at Weiser, Idaho. This ditch will cover about 20,000 acres of land.

Seventy-five farmers of Spokane and surrounding counties in Washington have organized a co-operative trading organization.

The Colorado Agricultural College will install and display irrigation plants at the Corn Exposition in Omaha in December.

Farmers near Asotin, Washington, are not satisfied with grain prices and are storing over a million bushels, hoping for better returns.

One thousand Newtown pippins are being planted near Eugene, Oregon, as a test orchard, that variety not having been tried there before.

One apple grower at Colfax, Washington, will exhibit two carloads of apples at the National Apple Show to be held in Spokane Nov. 15th and 20th.

The Indian agent at the reservation at Fort Lapwei, Idaho, will purchase a number of Jersey cows and operate a model dairy to teach Indians civilized methods of farming.

The directors of the Agricultural College of Colorado have called for a convention of farmers to be held at the college the week beginning January 3rd. During the week a farmers short course in agriculture will be held.

A convention has been called by the Governor of the Hawaiian Islands at which efforts will be started to change the land laws in such a manner that aliens will be prevented from taking up homesteads. Other changes in the land laws are also considered.

# Can We Ship Chicks?

**Read** Sept. 4th, we shipped 505 Rhode Island Red Baby Chicks to B. F. Selby, Big Pine, Cal. These chicks traveled 72 hours, (think that over) and 500 of them arrived alive and strong.

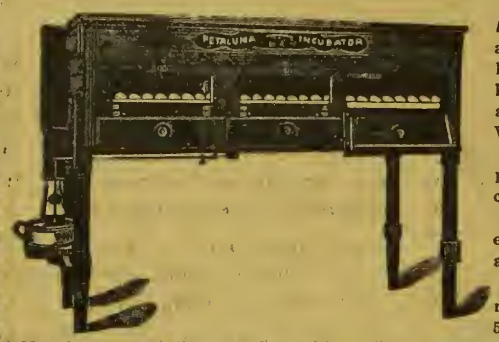
We know how to crate baby chicks to make them travel safe anywhere within 48 hours' travel. We have off large hatches every THURSDAY at present. Prices 10c and up. Send today for chick and egg catalog, it's free. Now is the time to get chicks.

## Pioneer Hatchery Company

*112 East Eighth Street, Los Angeles, California*

## Petaluma Incubators and Brooders

***Awarded GRAND PRIZE at Alaska-Yukon-Pacific Exposition, Seattle, Wash.; Two First Prizes and Silver Medal at the late California State Fair***



***Petaluma Poultrymen*** in accordance with their aim of attaining the highest degree of efficiency have steadily selected ***Petaluma Incubators*** and ***Brooders***—the Standard of the World.

We have equipped all the big poultry plants and have several contracts to complete before January 1st, 1910.

One firm of poultrymen has 47 504-egg Petaluma Incubators giving a capacity of 24,000 eggs at one time.

We also have contracts to equip a number of plants with from 10 to 20 504-egg ***Petaluma Incubators,*** besides dozens of poultry ranches with smaller numbers of machines.

***Winners of More Prizes Awarded by World's Fair Judges Than Any Other Make***

We have stated before and we ***again*** state that more Petaluma Incubators and Brooders are used than all other makes combined in Petaluma and all that great section of the country west of the Rocky Mountains, which is more than one-third of the entire United States, and the Petaluma is fast reaching a similar position among Eastern poultrymen. As rapidly as its merits become known does it supplant all other kinds.

## Midland Poultry Feed

Is the best ground mixed feed and hundreds of the successful chicken raisers use no other. Ask for it and take no other.

## Petaluma Incubator Company

**Petaluma, Cal.** **Indianapolis, Ind.**

Our General Agents for Incubators and Brooders and Midland Poultry Food:
**Aggeler & Musser Seed Co., 113-115 N. Main St., Los Angeles**

# West Coast Egg Food

***is the Best and also the Cheapest***

75 lb. sack, $1.90; 90 lbs. $2.25; 100 lbs. $2.50.

Hens must be kept in good condition and fed egg producing foods. We know how to make such rightly balanced rations. That is our business. And we have the best equipped mill for doing it. Others say their egg food is as good as "West Coast," but—

Or if you are distant from Los Angeles and have grain products cheaper than to ship them in from here, you can make your own Egg-Food, as good as anybody can make, by using

# EGG-MORE

This is not a strong tonic but a highly concentrated Poultry Food, and when mixed with shorts or other good grain products, just a little each day (according to directions) makes a rightly balanced ration. Your fowls will keep in good condition, feather out quickly and your hens will certainly lay more eggs, if you feed it. 4lb. packages, 35 cents; 12½ lb. sack $1.00; 25 lbs. $1.90, 50 lbs. $3.60; 100 lbs. $7.00. If not kept by your dealer, we will prepay freight within 300 miles on a sack of 25 lbs. or over.

## West Coast Mill

**Cor. Griffin and Alhambra, Los Angeles**

## MRS. C. D. HUBBARD'S WHITE WYANDOTTES

Eggs for hatching September 1st '09. Write for circular.

BOX 80, ROUTE NO. 1 SAN FERNANDO CAL

# Profit in the Poultry Yard

We solicit short articles of a practical nature from the farmer and utility breeder, giving their experience with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

### SHORT POULTRY COURSE.

By Mrs. Frank Metcalf.

THE short course in poultry at the University Farm at Davis was fairly attended this year. Introductory remarks were made by Prof. Jaffa in his usual happy manner, and poultry keeping in all its branches was taught. Prof. Jaffa began with Principles of Feeding, then took up the Feeding of Fowls, Forced Moulting and Water Supply, Concentrated Poultry Foods, Condimental Poultry Foods, Pure Food Law and the Poultryman, all illustrated and explained in an instructive manner.

Mrs. Basley lectured on Housing, Selection of Breeds, Feeding Turkeys, Care of Fowls, and Moulting. Mrs. Metcalf gave the History of Standard Making in three papers, beginning with the first attempt in 1849, down to the present Standard, and daily lessons in Judging and Scoring, or Object Lessons in Applying the American Poultry Association rules in Cutting for Defects. The Sanitary Conduct of the Poultry Yard was ably handled by Prof. Chas. G. Hyde, and the Marketing of Poultry by W. E. Coleman, of San Luis Obispo. V. G. Huntley taught the English method of killing, plucking, trussing and boning fowls, a very instructive part of the course; H. A. George, Incubation and the Care of Brooder Chicks; W. B. Herms, Poultry Entomology; C. M. Haring, Poultry Diseases.

The class this year was somewhat smaller than it was last, owing to other attractions. The Poultry Department is in rather an unfinished condition, but when really settled down to business, will make a center of learning second to none, as the natural resources of the farm are practically limitless. Sufficient appropriations should be voted to carry on the teaching of this branch of agriculture, which out-weighs in value by far the wheat crop, the hay crop, and if accurate accounts were kept, any other crop in the world. $700,000,000 worth of chickens and eggs are said to have been raised in the United States during the past year, and at least half this sum has been earned by farmers' wives under the most adverse circumstances as regards buildings and modern conveniences. Not all farmers neglect the wants of their women kind where poultry helps are concerned, but many still think anything good enough for a chicken, never stopping to think that Biddy pays her way far better than even the high priced and carefully housed Jerseys and Berkshires they pride themselves about.—Mrs. Frank Metcalf.

### POULTRY QUERIES.

**Lice and Mites.**

Will you please give me the best formula for killing lice and mites.—Inquirer, Riverside.

Mites may be gotten rid of by spraying the hen houses thoroughly with distillate, inside and out, top, bottom and sides, using sufficient force to penetrate the wood between joints and fill each nail hole and crack, for these are the places where they breed. Now it takes gallons and gallons of distillate to go over the buildings, and the dose should be repeated in a week, cleaning out the nests and washing the roosts at the same time, saturating everything with the distillate both times. Unless a house is too badly infested, this will clean it, but if they have gotten a foothold between the shingles, a new house will be almost a necessity. I did clean one such by turning it upside down and soaking the roof while in this position, but that isn't always possible. Kerosene emulsion is much cheaper, and some find it effective. To make it, dissolve one pound of soap in a gallon of boiling water. When dissolved, remove from the fire and add one gallon of kerosene, churning or stirring violently until it emulsifies, when it will be like thick cream. Add one pint crude carbolic acid, stir again and add ten gallons of water and use as directed for distillate. If used thoroughly once a month, mites are kept in check, and the carbolic acid acts as a disinfectant.

For body lice, use road dust half peck, sulphur one pound, tobacco dust one pound. Put this into a large pan and dust the fowls just as though you were washing them, working the dust freely among the feathers. Look for feathers harboring eggs, (or nits) and burn all such. Then when well dusted, apply the following: Take one ounce of oil of sassafras, and add two ounces of sweet oil. Put into a machine oil can, and drop a few drops under each wing, in fluff around vent, and on head and neck. I think, if you follow these instructions you will be well rid of the pests.—Mrs. Metcalf.

**Bloody Eggs.**

What is the cause of eggs being bloody? I have found several that were in this condition. I have often heard people tell in a joking way of a hen laying two eggs a day, but I have a Plymouth Rock hen that laid two eggs between 7 A.M. and 6 P.M. I am not mistaken for it is a hen that has run by herself for a year and a half, and there was no chance for another hen to be near her coop. Hen is a cripple and this is the reason she is by herself.—E. S. H., Escondido.

I had a hen myself that laid two eggs in a day, so know there are such. Blood spots in eggs are caused by inflammation or congestion of the oviduct. This may be caused by several things, too much animal food, too much red pepper, or being greatly excited or frightened. To relieve, give a small dose of Epsom salts, say a teaspoonful in a quart of drinking water, and give nutritious, but not stimulating, food until cured.—Mrs. Metcalf.

### HOW SHE RAISES PEKIN DUCKS.

During the last 19 years we have been raising and marketing ducks, keeping several different breeds, but were long ago convinced that the Imperial Pekin is the market duck par excellence.

As a general purpose duck we like the Rouen, and for eggs alone the Indian Runner stands at the head of the list.

There are two varieties of Pekins, the small or medium-sized white

## Have You Tried Coulson's No. 3 Condition Powders for Poultry?

A first-class tonic and conditioner like ***Coulson's No. 3 Condition Powder*** is of great benefit to the chickens, especially when used at this time of year.

***Coulson's No. 3 Condition Powders*** will prevent diseases, by keeping the flock in a thoroughly healthy condition. By the same means it will keep them laying longer into the molt, and their healthy condition will enable them to molt quickly and commence laying at an early date. As it contains no injurious stimulant, it can be used with perfect safety at all times and for this reason is fed in large quantities by numerous poultrymen.

**It Contains No Cheap Filler**

In buying a bucket or sack, therefore, every pound is of value to the chickens, and will give you large returns for the money invested.

For sale by all dealers or at the factory.

duck, so often seen around farmyards, and the large kind, known as the Imperial Pekin, the latter being only a little smaller than the common goose and having a beautiful cream-colored plumage. This is the variety of Pekins kept by the larger breeders in the East.

A common mistake, especially among farmers, is that ducks and chickens are fed and housed together, the result being a lot of half-starved specimens with bodies outstripped in growth by beak and feet.

A Pekin duckling will eat at one meal as much as three or four chicks of the same age and gain in weight in proportion, but the food must be of a somewhat different nature from that required by chicks.

For instance, dry feeds, such as wheat, cracked corn, etc., are unsuitable for ducklings, though they make excellent feed for growing chicks. In order to ascertain the difference in growth, a pair of Pekin ducklings and a pair of White Wyandotte chickens were weighed when 14 weeks old.

Ducks and chickens were hatched the same day; both were well fed, but neither was forced. The two chickens weighed four pounds and four ounces, while the two ducklings tipped the scales at 14 pounds.

We use both hens and incubators for hatching, those hatched under hens being kept for breeding stock. While small our ducklings are kept in a large yard, fenced with poultry netting. Twenty-five is the usual number for each yard and ducklings of different sizes are never yarded together.

Each yard is furnished with a separate house for the ducklings to sleep in at night. These houses are cleaned every day and fresh litter put in for bedding. For the first week we feed light bread (at least two days old), crackers, cornbread, cooked rice and rolled oats.

The bread is crumbled and either fed dry or moistened with sweet milk. We never confine our ducklings to any one kind of feed, because a variety gives much better results.

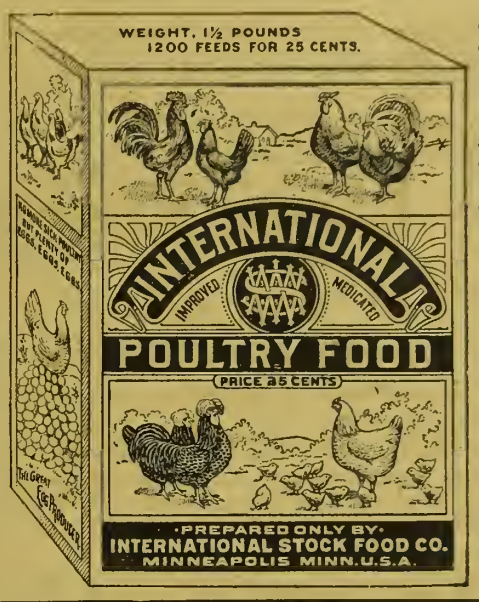
Green food is essential at all times for this purpose we grow large quantities of lettuce, onions and dandelion. These are chopped and fed, in addition to the grain food, several times a day while the ducks are small.

They relish these greens, no matter how plentiful grass may be; and when mixed with other food the greens furnish bulk, which is an important point in duck feeding.

A great quantity of food is required, but it must not be too highly concentrated. For this reason wheat bran is a prime factor in the feeding of ducks.

We feed our young ducks all they will eat five times a day, the hours for feeding being at 4 and 8 o'clock A. M., 12 M. and 4 and 8 o'clock P. M.—Anna Galligher in American Farm World.

## International Poultry Food



The wonderful egg producer. The great production of eggs has given the "International Poultry Food" a wonderful reputation throughout every state. We guarantee that it cannot be fed to hens at any time, winter or summer, without showing a large increase in eggs. You do not have to use the food at an extra expense, because it will make you more money after deducting its cost. One extra egg per month will pay the entire cost of feeding it and often more than double the supply. It contains no poisonous or injurious ingredients and has very superior merits.

Put up in 25c, 50c and $1.00 size packages, and 25-lb. pails $3.50.

## Fresno County Fair

WITH the closing of the Fresno County Fair Saturday night last, ended the second big county fair of Central California, and again was demonstrated the fact that an empire of wealth was rapidly coming to its own. Monday was opening day; Wednesday, Fresno day; Thursday, Kings County day; Friday, Tulare day; and Saturday, Selma, Kingsburg, and Fowler day—and every day was the big fair day.

In the livestock department were shown Mrs. Glide's shorthorned cattle exhibited at the Seattle Exposition, and among other entries were the Dutch belted herd owned by U. G. Strader of Ceres, J. E. Dickinson's herd of shorthorns, the Jersey herd of Geo. A. Smith of Corcoran, and Hereford and Angus herds owned by the Robla Lomas Cattle Co. of Visalia. C. J. Gilbert of Fresno had a combination herd of shorthorns and Jerseys. A fine exhibit of saddle horses, roadsters in harness, grade farm horses, German coach horses, and standard horses was shown. In the limits of this short article it is impossible to even mention the various exhibts, but conservative judges claimed the individual classes more extensive than and superior to those exhibited in any other fair on the coast this fall.

In the poultry department probably four hundred birds were shown, and in spite of the moulting season, the exhibits were fine and many excellent prize winners were shown.

In swine the exhibits were few, much to the regret of the many hog raisers, Berkshires and Poland Chinas only being in the prize winning class.

In the pavilion many fine displays were made, embracing the entire agricultural and fruit interests of this rich and wonderful county. The leading feature was the exhibit of the many varieties of grapes grown in an experimental way by the Federal Department of Agriculture, under the supervision of Prof. Georges Hussman, and now forming a part of the collection exhibited by the Fresno Chamber of Commerce. With few exceptions, these were all vinifera, and they are classed variously as "direct producers," wine, brandy, raisin, table and shipping grapes. There were a large number of booths for commercial displays, including the Swiss-Italian Colony Co., Fancher Creek Nursery Co., S. W. Marshall Nursery Co.; Holland & Holland, M. R. Madary, California Dried Fruit Co., J. M. Crawford & Co., Miss Kate Parsons with a floral booth, and George H. Croley with an exhibit of poultry supplies. Nectarines were exhibited by the Phoenix Packing Company, peaches from Guggenheim and the J. N. Armsby company, apricots from A. L. Hobbs company, an assortment of dried figs by W. F. Toomey and F. J. Hammond, canned figs by the Roeding Fig Packing Company, olive oil by the Roeding Olive Oil Company, and a fine display of canned fruit by the Griffin-Skelley Company.

The display of crude and refined oil from the Coalinga oil fields, in this exhibit, was varied and interesting, one section by the Fresno Chamber of Commerce, and the other by the Standard Oil Company. The chamber's collection took first prize at the late State fair at Sacramento.

The attendance should have been larger from the rich sections of country surrounding Fresno, especially from the fact that the total amount of cash premiums offered was nearly $10,000, and in addition a speed ring amount of $2000. However the management are to be congratulated upon a successful fair, and the county upon the live and progressive people who made the showing possible.

## Forestry

### DRAINAGE OF IRRIGATED LANDS.

BULLETIN 217 of the Office of Experiment Stations gives an account of experiments in drainage of irrigated lands in the San Joaquin Valley. The book is written by Samuel Fortier and Victor N. Cone.

The subject of this bulletin vitally concerns many irrigated lands of the West, especially those of certain parts of the San Joaquin Valley which have been ruined by ground water from irrigation canals in sections where the land is of such a nature as to convey the water long distances. In a letter of transmittal to the Secretary, Mr. A. C. True, Director of the Experiment Station Service, says:

"In almost every irrigated section large areas of the lower lands have been ruined by the rise of the ground water and an accumulation of alkali, and the usual course has been to abandon the injured lands and transfer the water used on them to other lands. Often this means the abandoning of costly improvements, the building of new ditches and new structures, and the planting of new fruit trees and vines. These experiments show that drainage, which will hold the ground water below the roots of trees and vines, will prevent the injury of orchards and vineyards, and will quickly restore lands already inpured at a cost much below that of reclaiming new lands and providing new equipment. While the experiments were confined to one region, the methods employed and the results obtained will apply to other sections having similar conditions. It is therefore recommended that this material be published as a bulletin of this Office."

The bulletin has 58 pages of instructive matter and several charts and illustrations. It may be secured by addressing Irrigation Investigations, Berkeley, Cal.

### IDAHO FORESTRY ASSOCIATION.

Northern Idaho Forestry Association, composed of lumbermen of Washington, Idaho, Minnesota, Wisconsin, Iowa and Nebraska, owning hundreds of thousands of acres of virgin forest lands in the pan-handle of Idaho, will urge the forestry department, headed by Gifford Pinchot, to co-operate with it in the protection of the standing timber, including several hundred thousand acres in the national forest reserve, declared to be the largest stand of white pine left intact on the continent. The association expended more than $100,000 this year in building trails, maintaining stations and patrols and fighting forest fires.

It is purposed to build a series of twenty dams at the headwaters of the Coeur d'Alene, St. Maries and St. Joe rivers and their tributaries to create enormous reservoirs to store the snow water from the mountains for release during the dry season. This will provide a means to fight fires, insuring also a steady flow in the streams for logging, irrigating and mining purposes and checking the floods during the spring freshets, thus eliminating the danger of the destruction of millions of dollars' worth of property by the ravages of swollen mountain streams.

A. L. Flewelling of Spokane, chairman of the committee on conservation, will leave for Washington, D. C., early next year to discuss the matter with Mr. Pinchot and endeavor to enlist federal aid.—Irrigation Age.

### FORESTRY NOTES.

Most farms have on them small or large areas that can be utilized for forestry better than for anything else.

A good forest gets its light and air at the top and not at the sides. Consequently its relative leaf area is small and growth is slow.

In the making of timber, the bole of the tree is the principal thing. It is desirable to have it grow straight and tall, and the tuft of branches at the top is the means of elaborating the food that goes down and enlarges the bole.

### Lippia Repens.

Where may I secure lippia repens? How is it sown? Will it smother out bermuda grass? Also what is the best way to kill bermuda?—Subscriber, Kerman.

Lippia may be secured of almost any nurseryman or seedman, and in many sections in the state is growing wild and can be spaded up along the roadsides. It is not reproduced from seed, but from runners, or rather from sod, which is grown in flats when produced commercially. The sod is cut up into sections, perhaps one and a half or two inches square, and these are set out where wanted for lawn, ten or twelve inches apart. It will spend the winter in getting rooted, perhaps spreading somewhat, but in the spring as soon as the warm weather comes, it will cover the entire plant. Then from this, little sections may be spaded off and transferred to other plats if desired. It is one of the simplest plants to grow and will stand a wonderful amount of abuse. We cannot say positively that it will replace the bermuda entirely, but think it will, that is, if it is given a fair start. If planted in a field where bermuda is already thick, it is probable that it could not make a thrifty growth.

The best way to subdue bermuda is by thorough culture. If it is in lawn and has secured a firm foothold, one must either let it answer for the lawn or give it up to clean culture to some crop until the bermuda is killed out, or else take up the sod deep enough to remove all roots and replace with fresh soil which is free from bermuda. If thoroughly cultivated out and lippia planted, we believe the bermuda will not again be troublesome.

### Alfalfa in Orchard.

Do you think it advisable to sow alfalfa in young peach orchard? Will it injure trees or soil to check up this land and sow alfalfa, irrigating it about once a month?—J. T. M., Kerman.

Experiments made by the New York and other experiment stations have proved conclusively that the clean cultivated peach orchards have given about fifty per cent more profit than the orchards in which sod was allowed to remain. This profit was net, over and above the extra cost of cultivation. The peach requires a warm soil and plenty of air admitted to the roots. Where these conditions are prevented by sod or alfalfa which is irrigated once a month, we do not think the best results can be obtained. However, it is possible that with young orchards just planted a strip through the center might be of no great injury, but it should be plowed up before the trees reach bearing age, if best results are expected.

### Curl Leaf.

Can you give me a cure for curl leaf in peach trees?—Subscriber, San Luis Obispo.

The remedy is either the sulphur and lime wash or Bordeaux mixture applied before trees leaf out in the spring. Once the leaves show the curl, there is no remedy. The spores of this disease are scattered over the bark and attach themselves to the leaves and begin growing. The winter spraying prevents this.

### Asparagus.

How is asparagus cultivated to yield a good profit?—Subscriber, San Luis Obispo.

To give complete instructions for asparagus culture would exceed the limits of this department. By referring to the issues of March 18th and 25th and April 22nd of this vear, you will find articles which will give you pointers.

### Grapefruit.

We recently had inquiry as to value of Marsh Seedless pomelo for arid interior valleys. The question was referred to Mr. Alfred P. Griffith at Azusa, and he writes:

It is my experience that Marsh Seedless has not proved as heavy a bearer as the Nectar nor does the fruit size up as well or as early. I have had no experience with other varieties except Triumph which does not size up in this locality. My experience is in light soil.

### Rose Rust.

I enclose leaves from several of my rose bushes. They come out looking nice and thrifty, then turn yellow or spotted or curl up and drop off. Please tell me what to do for them —Subscriber, National City.

These were sent to C. O. Smith, Assistant Plant Pathologist of the Southern California Station at Whittier. He writes: "I find the leaves have what is known as 'rose rust.' This is a fungus that in external appearance resembles the rust of the blackberry. No successful treatment of the trouble is known. The disease although common does not appear to do very great injury."

### Silos—Book on Swine.

Is the silo in successful operation in Southern California, and if so by whom? I would like to go and see the parties and get full information. What is the best book, in your opinion, in regard to the care of swine?—G. G. F., Tipton.

There are scores of silos around Los Angeles and if you care to go into the office of the Cultivator they will tell you where there are many of them. If you care to come out here to the Minnewawa we will show you our silo now filled for winter feeding. As soon as the first frosts cut down the sorghum we will begin to feed it out. Are you interested in cattle for dairying? We are making a forced sale of young males 27 to 5 months old and have some extra good ones at bargain prices for the next two months. I use Fulton's Home Pork Making and find it is sufficient for my purposes. Coburn's Swine in America is considered one of the best authorities.—M. E. S.

### Holstein or Jersey?

I am making a start in the dairy business. Which do you consider the better breed of cattle, Holstein or Jersey for the purpose mentioned?—C. C. P., Santa Clara.

There are good cattle in every breed and poor ones as well. I am a Holstein breeder, but have always liked

the Jersey cows very much. I really have no feeling in the matter and should debate some time if I were beginning which of the four breeds to choose, Jersey, Guernsey, Ayrshire, or Holsteins. The Ayrshires and Holsteins are not so expensive to start a herd as the other two breeds. The Ayrshires are not yet as much developed in California as in other places. The Holsteins are probably more plentiful than any other pure bred cattle in the State at present time.—M. E. S.

### Best Olive to Plant.

Can you advise me what variety of olive to put out from a purely commercial standpoint? My soil is a red clay loam.—C. F. C., Orangehurst.

The only olive that has been proven in California is the Large Mission variety. The others we are hoping may be good. The Manzanillo is hopeful, yet this season some are showing rot at the heart. The Queen olive or Sevillana has this fault and for that reason is pickled green.

The olive requires heavy soil with moisture to make its best growth and to produce heavy crops. They become profitable after five years when on good soil and well cared for as other trees and vines. While the olive will live on poor land and will make an effort to fruit when it reaches the age of ten or more years, this is distinctly not a profitable way to grow them. Treat an olive tree with the same care that you give a peach tree and it will give double the returns of the peach tree and its life is many more years.—M. E. S.

### Dairy Questions.

When is the best time to breed young heifer to make a good milker of her? Will time of breeding affect sex of calf? A cow lately bought, said to be a five gallon cow, gives but one gallon, and from one quarter of her udder, but a teacupful of milk. What can we do to increase flow? We feed best loose alfalfa and about 1½ quarts bran mixed with one tablespoon of oil-cake meal morning and night, at noon oat hay. Will feed pumpkins later. Should we feed with seeds or without?—J. R. F.

Breeding her at fifteen months old would be the preferred age, yet I would waive a month either way to bring her in in the summer, August or early fall months as September, October. A heifer calving at that time is worth more as a cow because she will milk continuously for the year.

There are no understood laws in regard to sex producing. Sometime we may understand this matter, but not now. The Texas cattle men did not like bulls kept up and fed during the winter and then turned out fat with thin, weak cows, as it seemed to give an undue number of "she stock" in the calves. That the balance of Nature will be thrown to the weaker side seems to be a preservative measure, but it is not found to work out in the dairy herd.

The older cow has probably an udder that has inflamed at calving time and little can be done now to bring back the milk flow. The next time she freshens watch that she is milked out clean and that the udder does not become inflamed badly.

The feed is all one sided on the protein. I should prefer to give corn or rolled barley for most of the bran and cut out the oilcake altogether when feeding alfalfa hay freely. Make all changes slowly in cow feeds as they are easily disturbed in their digestions. Give them all the pumpkins they will eat up clean, the seeds do not matter at all.—M. E. S.

# Money Making Little Liners

In this department we will insert your advertisement under a classified head for 1½ cents per word. No ad accepted for less than 25c. Our classified columns are the clearing house for our many thousand readers.

## MISCELLANEOUS.

THE ANCHOR EGG SEPARATOR works perfectly; no well regulated hotel or household can afford to be without it." So says Delmonico's Chef. Send ten cents or ten names of persons keeping poultry, and we will send one postpaid. Or for 25 names we will also send postpaid "THE POULTRY MANUAL" by those high authorities, F. L. Sewell and Ida R. Tilson, profusely illustrated. WEST COAST MILL CO., 705-709 So. Griffin Ave., Los Angeles, Cal.

A LABOR SAVER FOR WOMEN. Send 10 cents for three weeks trial. Electric Laundry Compound, washes clothes without rubbing. Saves time, labor, and clothes. No lime, lye or acids. Eight washings 25 cents. Money back if not satisfied. ELECTRIC COMPOUND CO., 823 S. Spring St., Los Angeles, Cal.

FORTUNES IN SUGAR—STOCK FOR sale in a new sugar cane plantation. Small monthly payments will secure for you an interst in this great enterprise, that will pay you an annual income for life. Write for booklet, LOS HORCONES PLANTATION CO., 724 Grosse Building, Los Angeles, Cal.

PRODUCER TO CONSUMER—Write to me today for prices on dried fruits. We raise them and Banning fruit is of the best. If you like fruit, our prices are low enough, you can afford to eat fruit the year round. Write now to CHAS. W. MIXTER. Banning, Cal.

HEALTH—LATEST SCIENTIFIC DISCOVERY. You positively can renew your youth and prolong your life. Our book "How to Live 100 Years" and 15 sheets of instructions for 50 cents. NATIONAL HEALTH LEAGUE, 545 Douglas Blk., Los Angeles, Cal.

A GOOD INVESTMENT. MOST MEN are working for money. The wise man makes his money work for him. Write for prospectus. COLUMBIA COMMERCIAL COMPANY, 204 East 9th street, Los Angeles, Cal.

WANTED TREES—A FEW THOUsand apricots, peaches, pears, etc. IMPERIAL VALLEY NURSERY. Imperial, Cal.

## CABBAGE BEETLE.

The cabbage beetle is a difficult insect to combat, but those who are raising young plants often find considerable help by dusting the young plants very thoroughly with air-slacked lime or coal ashes. This is quite commonly done by putting the substance to be dusted over the plants in a cheesecloth bag and shaking it over the rows. Fleabeetles commonly dislike to eat plants that are covered with dust or any substance which is not palatable and will oftentimes seek other food plants rather than eat those which have been so treated. To make the remedy effective it should be very thorough, so that the plants are well covered with the dust, and if the remedy is washed off by rain or for other reasons, the plant becomes exposed to the beetles again, they should be re-treated.

"See the shadow the book throws across my waist? It's like the shadow caused by the metal burner or tank of your light—with this difference, I can take away the book and get direct, shadowless light. See the point?"

MORE LIGHT

—where more light is needed—that's what The Angle Lamp gives. It is oil lighting at its best with the smoke, odor and bother eliminated by new methods. It throws upon book or table a direct shadowless light delightful to read or work by.

THE ANGLE LAMP

resembles a handsome gas chandelier in its appearance and in its convenience. It is lighted and extinguished like gas. May be turned up full or turned low without odor. Safely filled while burning. Requires filling once or twice a week. Floods every corner of the room with a splendid light. Costs about 3 cents per week. Made in 32 varieties, a style to suit every need and taste. Call or write for catalog.

## 'TWIXT THE ROWS.

Times I straighten up an' llsten,
Seems a small volce in my ear
Callin', "Father, here's me comin'!"
Like a sweet bell, ringin' clear.
Sunbonnet a-flappin',
Bare, brown toes,
Little Jane comes steppin'
'Twixt the rows.

Clouds all swallered up in sunshine,
Birds a-burstin' into song.
'Here's me comin'! Here's me comin'!'
Callin' all the way along.
Little basket swlngin',
Up an' down it goes,
As little Jane comes singin'
'Twixt the rows.

Clear up yonder I see mother,
Checkered apern wavin' high.
"Father, what you s'pose I've brung you?"
Little voice a-pipin' nigh.
Muscles all a-throbbin',
But hoein's easy, so's
Little Jane come bobbln'
'Twixt the rows.

Then I rouse up from my dreamin',
Kind o' chill seems ln the alr,
Look with both my old eyes peerin',
Lttle laughin' thing ain't there.
Forty years I've been a-skippin',
Years o' suns an' snows,
Since little Jane came steppin'
'Twixt the rows.

—Annie Hamilton Donnell.

## DECORATIONS FOR HALLOWE'EN.

THE first thought of the prospective Hallowe'en entertainer ls naturally appropriate decorations, and these must be not only attractive, but "spooky." Where one is lucky enough to be in reach of autumn leaves, a charming effect can be secured by using them lavishly. Cover the walls with branches and strew the leaves on the floor and hang tbe room with square jack o' lanterns made of black cardboard. Lacking these, twisted strips of crepe paper in alternating colors, red, yellow, orange and black, may be carried from the center of the room to the walls where the strips are caught with a back cat's head, owl's head or spider cut out of cardboard. Let the ends of the strips hang down nearly to the floor. A room all in red or yellow could also be made very striking, but you will find that a touch of black here and there will greatly add to the effectiveness. Yellow pumpkins are of course the most effective decoration possible. Pumpkins big and pumpkins little cut out to form jack o' lanterns can be used for the entire lighting of the rooms.

A big pumpkin hollowed out, filled with balls of popcorn, can be used for a centerpiece on the table. Frills of red and black or yellow and black crepe paper placed under the pumpkin help to carry out the scheme. Small jack o' lanterns of hollowed out red or yellow apples or oranges can be used in addition.

At a table where witches are supposed to hold frolic, the decorations should emphatically declare the fact. In the center erect a substantial tripod and from it suspend the fateful caldron, which, on this occasion, might contain nothing more harmful than some fresh, sweet cider to which, later on, the guests would be served by means of a long-handled tin dipper provided for the purpose. A fine vegetable fire can be made under the kettle by piled up red chile papers and small carrots on a few sticks of wood, or jagged toothed yellow and red cardboard can be used to simulate the blaze.

One can find at the stores many grotesquely fascinating masks and creations of all kinds in papier macne, black cats, witches, screech owls, spiders, and spooky things of all descriptions, but the home made decorations of pumpkins, apples and leaves seem more in keeping wtih the splrit of a homely frolic such as Hallowe'en, and think of the fun of making them! —R.

## HALLOWE'EN CUSTOMS.

With the gathering in of the pumpkin, squash and corn, and with the crisp, cold weather of October do we associate Hallowe'en. It ls strange how many have forgotten the myth of Hallowe'en and it is even stranger how many never knew it.

In early times the Druid priests had special services in the oak forests for Hallowe'en. It is supposed to be a time when supernatural forces hold sway in the realms of humanity. In England and Scotland we find Hallowe'en celebrated with its true meaning. Tbe story of these strange forces ruling everywhere on thls particular night is banded down from generatlon to generation. Scott and Burns have written at length on the ghosts and witches of Hallowe'en. Burns gives us such a weird picture in Tam O'-Shanter that we hardly know whether or not we have had a strange dream. We can scarcely realize that we have read a poem upon which a great man has spent time and energy. In America Hallowe'en is regarded as a time to be spent in fun and merrymaking. Many open their homes for parties on this night. Everything is made to appear weird and ghostlike. The house is often lighted merely by the fire ln the fireplace or perhaps by Jack-o'-lanterns. Fortunes are told and ghost stories of tbe most weird nature are appropriate. Popping corn, roastlng nuts and marshmallows and ducking for apples are quite common amusements.

The formality that exists at parties is not evident here. Anything approaching form or ceremony ls out of place. The guests are often requested to sit on the floor. Candy, apples and fruit are usually served for refreshments. In many places the indoor amusements have given place to outdoor sports. The corn roast and the husking bee are appropriate. Oftentimes amusements of a very different nature are indulged in. Crowds go about surprising people by ringing door bells, rapping at tbe windows, etc. Again many times movable property is carried away and sometimes, to the disgrace of the offenders, destroyed. Destruction of property should always be avoided, as should every other practice which is likely to offend.—Farmer's Tribune.

## HALLOWE'EN AMUSEMENTS.

The season of parties opens with October's first appearance. Comparatively few towns where there are lively young people have not enjoyed the jolly corn roast on some night in early October. Then with October's last days the time is merrily spent in contemplating Hallowe'en. The last quarter of a century has in a measure spoiled the true meaning of the Hallowe'en feast and frolics. Too many of our younger generation think of it only as an evening for malicious intents. Parents, young men and women should do all they can to stop this feeling and they can only do it by having a genuine Hallowe'en party. The expense for such a party need not be large; but endeavor to have everything appear as spooky as possible. This may be accomplished in many ways, but the following has been tried and proved very successful. When the invitatlons are sent out, request that the girls come dressed as ghosts and the men in black robes, masks and skull caps. Let the lights in all the rooms be dim and cover them with black shades. Jack-o'-lanterns may also be used for light. Cornstalks, sheaves of grain and vegetables may be used for decoratlons. Candles may be made of carrots and used for lighting the hallways and rooms where the wraps are to be removed. As the guests arrive, greet each in a cold, severe manner and yet whisper all the time or speak in a low voice which ls void of all implicatlon. To liven up such a party and

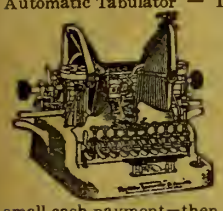
# A $100 Typewriter for 17 Cents a Day!

Please read the headline over again. Then its tremendous significance will dawn upon you.

An Oliver Typewriter—the standard visible writer—the $100 machine—the most highly perfected typewriter on the market—yours for 17 cents a day!

The typewriter whose conquest of the commercial world is a matter of business history—yours for 17 cents a day!

The typewriter that is equipped with scores of such conveniences as "The Balance Shift"—"The Ruling Device"—"The Double Release"—The Locomotive Base"—"The Automatic Spacer"—The Automatic Tabulator"—"The Disappearing Indicator"—"The Adjustable Paper Fingers"—"The Scientific Condensed Keyboard."



## Yours for 17 Cents a Day!

We announced this new sales plan recently, just to feel the pulse of the people. Simply a small cash payment—then 17 cents a day. That is the plan in a nutshell.

The result has been such a deluge of applications for machines that we are simply astounded.

The demand comes from people of all classes, all ages, all occupations.

The majority of inquiries has come from people of known financial standing who were attracted by the novelty of the proposition. An impressive demonstration of the immense popularity of the Oliver Typewriter.

A startling confirmation of our belief that the Era of Universal Typewriting is at hand.

## A Quarter of a Million People are Making Money With The OLIVER Typewriter

### The Standard Visible Writer

The Oliver Typewriter is a money-maker, right from the word "go!". So easy to run that beginners soon get in the "expert" class. Earn as you learn. Let the machine pay the 17 cents a day—and all above that is yours.

Wherever you are, there's work to be done and money to be made by using the Oliver. The business world is calling for Oliver operators. There are not enough to supply the demand. Their salaries are considerably above those of many classes of workers.

### "An Oliver Typewriter in Every Home!"

That is our battle cry today. We have made the Oliver supreme in usefulness and absolutely indispensable in business. Now comes the conquest of the home.

The simplicity and strength of the Oliver fit it for family use. It is becoming an important factor in the home training of young people. An educator as well as a money maker.

Our new selling plan puts the Oliver on the threshold of every home in America. Will you close the door of your home or office on this remarkable Oliver opportunity?

Write for further details of our easy offer and a free copy of the new Oliver catalog. Address

**The Oliver Typewriter Company**

**Wireless Telegraphy** Now is the time to engage in the study of this new science. 1,000 operators wanted to fill positions created by U.S. government action. Salary of trained operators ranges from $15 to $40 per week.

**The Wireless Institute of California**
is the best equipped wireless school in the world for teaching this science. We are located so that our high power station is in daily conversations with all stations on the Pacific Coast. It. It. Commercial School of Telegraphy owned and operated in connection with us. We can qualify you for a position anywhere. Young men and women write for descriptive circulars.

**WIRELESS INSTITUTE OF TELEGRAPHY**
Official Training School for Wireless Telegraph Companies
Central Trust Bldg., Van Ness Ave. cor. Golden Gate
SAN FRANCISCO, CAL.

Paradise, Butte county, held a fruit and flower show last Saturday.

to make each one feel at ease let someone in a loud whisper propose to play hide and seek. Each ghost hides and is sought. After the unnaturalness has worn off let the party sit down in a half circle and ask each one to tell a ghost story in a very ghostly voice. While these stories are being told, the hostess may quietly step out and return with rosy red apples, pop corn and home made candles. After refreshments are over let each one remove his mask; then turn on the lights a little more and ask some good reader to read Tam O'Shanter. Then if the evening is not spent, let the lights be turned on and such games as egg rolling, trying to pick up an egg with a teaspoon and to pick apples out of a pan of water with the teeth may be indulged in.—Ex.

### HOMELY HINTS.

Soak vessels in cold water rather than hot to remove dough or any substance that may adhere to cooking utensils.

Care should be taken to thoroughly air clothing after the weekly washing and ironing. Many cases of cold and rheumatism have been contracted by wearing damp clothing or sleeping in imperfectly aired sheets.

To fry bacon lay thin slices in a cold frying pan and heat gradually. It is not so apt to curl and shrivel cooked in this way.

Bacon is better if fried without freshening, as it retains its flavor if not put into water.

If eggs are served with fried bacon, have the grease piping-hot when eggs are dropped in and cook quickly to prevent absorbing grease.

All salt fish should be well rinsed before putting to soak and always placed in water skin side uppermost.

If codfish is allowed to simmer very slowly on back of stove until soft and then picked from the bones, it will be more easily done than to soak in cold water.

The odor of fish can be removed from knives and cooking utensils by washing in water containing common baking-soda.

Kerosene oil is most excellent for cleansing purposes. It is particularly cleansing to porcelain bath tubs or sinks.

Common wood-ashes on a damp cloth will remove stains from enameled pans and cups. If the cloth is wet with ammonia and then dipped into the ashes the effect is almost magical.

When packing for traveling or to lay away, if sleeves of coats or jackets are stuffed with soft tissue-paper they will be found free from creases and wrinkles.

If wet shoes are filled with paper when put away the paper will absorb the dampness and the shoes be left dry and soft.

Milk toast is much better if the hot, creamy milk is served in a covered pitcher, each individual pouring it onto the hot buttered toast. It prevents the toast from becoming soggy.

Woolen blankets should be placed in boxes lined with newspapers, and wrapping the blankets well in papers is an additional precaution against moths.

Wash the egg-beater immediately after using while the egg is soft and more easily removed.

When cleaning a carpet sweeper be careful not to pull hair and threads from the brush without first clipping all threads and hair with the scissors as pulling will injure the bristles of the brush.

In order to work easily, perfectly and effectively, as well as to preserve the carpet sweeper, it should be frequently cleaned.

Apply vaseline to a burn immediately. The sooner air is excluded from the seared surface the less pain and danger of a blister.

Heavy irons are preferable to light ones. They do better work and more easily.

A very palatable dish can be made from left-over rice if placed in a well buttered baking-pan—first a layer of rice, then grated cheese covered with white sauce until the pan is filled. Bake 20 minutes in a moderate oven.

| Light Amber | 10@12 |
| Extracted W W | 7½ |
| Extracted light amber | 6½@7 |
| Beeswax per lb | 25@29 |

### Hay.

Scott, Magner & Miller say:

Receipts of hay for this week have been 2900 tons, which amount is considerably less than we received during the preceding week. Considerable of the hay that has come in this week has been handled with some difficulty, as the entire week's business has been so unsettled and demoralized by our week's Portola festivities that the entire conditions have been unsatisfactory.

There has been no particular change in prices. Fancy wheat hay and choice red oat hay, which have been in light supply during the week have sold fairly well. The entire line of medium varieties of hay have moved off slowly, and with no better results than were obtained during the previous week.

Alfalfa hay has arrived freely by water, and much effort has been necessary to obtain sale for these large quantities. Concessions in prices are freely made to induce buyers to take hold. When the river banks are entirely cleared up, a little better tone to the market may possibly be looked for.

Arrivals of straw are very moderate, and while the demand is equally so, there is a shade of firmness to the situation on account of the known necessity of beginning to draw upon the warehouses for our immediate supply.

This week's quotations are:

| | |
|---|---|
| Choice wheat hay | 1900@20.00 |
| No. 1 wheat or wheat & oat | 17.00@18.00 |
| No. 2 wheat or wheat & oat | 14.00@15.00 |
| Choice tame oat | 16.50@17.50 |
| Other tame oats | 14.00@15.00 |
| New crop wild | 11.00@15.00 |
| Stock hay | 8.00@9.00 |
| Alfalfa | 10.00@13.00 |
| Straw | 55@65 |

### Grain.

| | |
|---|---|
| Wheat No. 1 | 1.75@1.80 |
| Barley No. 1 | 1.35@1.46¼ |
| Oats white | $1.55@1.60 |

## Citrus Market

LOS ANGELES, Oct. 20, 1909.

Valencias are still calling for the best price of the season, and as but a small quantity remain to go forward, the outlook is good. On the new crop of navels no quotations are made as yet, but few cars going on. By the 7th, 8th and 10th of November, the first regular shipments for the trade will go forward, and from present outlook good prices are expected.

Lemons are bringing the highest prices of the season, and very satisfactory conditions prevail. Even the auction markets are running well up, and a buoyant condition prevails all aiong the line.

**SHIPMENTS.**

Total shipments of citrus fruits since Nov. 1, 1908; 37,905 cars, of which 31,768 were oranges and 6137 lemons. To same date last season; 29,394 cars, of which 24,517 were oranges and 4877 lemons.

## CEMENT POSTS.

Quite an extensive use of cement posts has been made in the last few years, but it is a little too soon to draw conclusions as to whether or not the present type of post is practical. It can reasonably be expected that a considerable share of the cement posts now bearing fence will not prove as satisfactory as expected, for the reason that a good many of them have been made by inexperienced persons. The making of cement posts is possibly more of an art than a great many imagine. There are a good many who have made a careful study of the cement post under farm conditions who are of the opinion that the present design of the post is not the best. The chief fault with the cement post at present is that the re-enforcement material is not properly placed. The weak point seems to be at the surface of the ground, as posts break at this point more often than elsewhere when subject to strain. It is believed that this fault can be practically overcome by re-enforcing the post with extra wire at this point. An authority recommends that the re-enforcing material should be doubled for at least a foot above and a foot below the surface of the land. This will cause the post to "give" more uniformly in all parts of its length, or, in other words, one part of the post will be as strong as any other relative to its position. This extra re-enforcement will cost but a trifle. Enterprising makers will no doubt bring the cement post to a high state of perfection in the next few years, and the indications are that the post in the future will be one in which steel and cement are properly combined.—Farmer and Stockman.

## THE ROAD OF THE FUTURE.

All road builders are now engaged in trying to devise a road which will stand motor traffic. Many new methods have been tried, with varying degrees of success, but none of them seem to be perfectly satisfactory. If broken stone is to form the wearing surface, then some means must be found to hold the binding particles so firmly that they cannot be sucked out; and sufficient strength must be given to the mass to enable it to withstand the sliding action of the wheels at bends and turns. Several kinds of tar macadam answer fairly well, but they are expensive.

It seems to me that the most promising kind of road for heavy automobile traffic is what is called Durax in England. It is a pavement of three-inch irregular cubes of hard stone, laid in small segments of circles. These stones can be cut by machinery, and are comparatively inexpensive; they are laid without grout, but there seems to be no reason for its omission except the cost. Great quantities of this kind of pavement have been laid in Germany.

I have no doubt that it will surprise most people here to learn how little material is used in the making of some of the finest roads of Europe. The average thickness of the national roads of France is only five and one-eighth inches; 11 per cent. of them are less than two inches thick, and 42 per cent. are less than four inches thick. Yet they stand constant and often heavy traffic with impunity, and are always in a perfect state of repair. Perfect repair is, indeed, essential, for it needs no argument to show that roads so thin must be free from irregularities if they are to stand at all.—From Ernest Flagg's "Road Building and Maintenance" in the November Century.

In all kinds of farming, profit comes only when we guard against losses.

Taking care of the fertility of the land is insuring future crops.

There is nothing quite equal to gasoline engines for farm power.

The poor road makes delivery of farm crops expensive.

The study of soils is often the first step toward success.

# Business Notes

### NEW GASOLINE ENGINE.

A high-grade Gasoline Engine of 1-horsepower at a moderate price has at last been placed within the reach of every farmer.

There are a thousand and one things for which a 1-horsepower engine can be used to great advantage. Fairbanks, Morse & Co., have placed on the market the "Jack Junior" engine (little brother of "Jack of all Trades.") It is a 1-horsepower horizontal evaporator tank engine entirely self contained, which with the battery box is mounted on a wood base. By filling the tank in the iron base of the engine with gasoline and the evaporator tank or hopper jacket with water, the engine is ready to run.

This is a 4-cycle engine practically frost proof. All parts are carefully designed and are very accessible. This engine is large enough to do very effective work pumping, running cream separators, churns, and other small machines, it is durable and will give excellent service.

Fairbanks, Morse & Co., are probably the largest manufacturers of gasoline engines in the world. They will be glad to send the book describing fully the new Jack Junior one horsepower engine to all interested parties. See advertisement in this issue.

### COOKING SUGGESTIONS.

"The pie that Mother made." How many of us have said that and laughed at someone's expense when the crust was heavy or the "stuffins" not cooked. The young housewife looks tearfully at the bread that won't raise or the biscuits that are so heavy and wonders what "the lord of the manor" will say when he sits down to an incomplete meal.

A valuable little book called "The Enterprising Housekeeper" has proven of great benefit to thousands of good housewives who have had to contend with the unexpected visitor, the "finicky" appetite and the many other little things that tend to make her life miserable. This book was published to sell for twenty-five cents, but for four cents in stamps, to cover the cost of mailing, the publishers will forward it to you. Address The Enterprise Manufacturing Company of Pa., Dept 55, Philadelphia, Pa.

It contains two hundred recipes of the sort that proves so beneficial to the housewife and makes the practice of economy easy. Many helpful suggestions are made for teas and luncheons. Numerous illustrations of household utensils run through the book. Altogether the book is the best of its kind seen for some time and should be in every household.

## State Farm Educating Youth in Scientific Methods

Picnic Scene at the Agricultural High School, Davis

WHILE we will not say that the chief end in life is money, we must consider that the attainment of the ideal country life and the attractiveness which is necessary to lead the youth to see the good there is in it, is dependent upon the financial returns of the labor and time expended. Something must be done, therefore, to increase the profits of agriculture. We may say that the first demand of modern agriculture is how to produce larger crops and better products at less cost and still maintain the soil fertility. The larger part of California agriculture has consisted of a mining of the soil rather than a farming of the soil. We have gone at it in the same manner that the miner has dug for gold in the mountains and gravel beds. The result is that our soils are less productive than formerly; we have taken out the soil fertility which was most readily available, and now are confronted with the problem of making available the remaining fertility and of building up the soil so that the original yields may again be secured. We find we must call upon the experiment station and the scientist to help us. The scientist has been working on this problem for half a century or more, but it is only very recently that we have looked to him for help. We find that by following the results of his experimentation and his directions, that we have better yields of better products from our soil, and at the same time put our soil in better condiion for future production.—Prof. Leroy Anderson at Farmers Week Session.

# A Week of Instructive Features at the State Farm

## University Instructors and Others Fill the Week with Good Things

IN AN article describing the State farmers' institute at Davis last year, the Cultivator said: "The attendance at the institute was disappointing. Especially was this noticeable as to the people of Yolo, Solano and Sacramento counties. But few people from these sections could be found, though many farmers were coming and going to and from Davis at that time." If that was true last year, it was more so this, for the absence of local farmers was very pronounced. Inquiry as to the cause brought out the usual "busy" excuse, and the feeling of many farmers that President Wheeler is not doing all for the farm at Davis that it deserves. But, regardless of any attitude of President Wheeler, the College of Agriculture gave last week a course of lectures which would well have repaid any producer in the state for attending. The program began on Monday morning and continued until Saturday afternoon, the day's exercises starting at eight in the morning and ending at nine or ten in the evening.

It was a week of hard work for everyone who attempted to take in all of the lectures. In fact, one could not get them all, for part of the time a lecture was being given in Room 10 when other exercises were taking place in the pavilion.

It is impossible to give a report of each day's program, but on this page and the editorial page this week will appear items from the various sessions; and from time to time in the future, other addresses will be given.

### The Farm.

The 780 acres which comprise the farm show but slight change since last year. The dormitory then nearing completion is now occupied and affords a good home for the boys attending the school. Adjoining it is the dining hall almost completed. To the south are two buildings under construction. The frame work of one of these shows a building of good proportions to be devoted to verterinary practice and bacteriology; the other, marked only by a foundation and a few piles of lumber is to be the horticultural building. Back of this is a small work shed where grafting and similar work will be taught. These, with some additions to Prof. Shaw's building devoted to grasses and cereals, are the only structures erected on the farm since the last institute.

The greatest addition to the farm is probably the registered stock acquired within the last few months. Holsteins and Jerseys are both well represented in the big dairy barn, as are also Shorthorns of the beef strain. All these were used in the judging contests held during the week by Instructors Hawk and Phillips. In sheep the only breed represented is the Shropshire.

### The Program.

The intense interest manifested during addresses and discussions showed that facts were being absorbed that would be carried to the farms and later appear in working results. Prof. Wickson, Dean of the Agricultural College, was present nearly all of the week, as was Prof. I. P. Roberts, formerly Director of the Experiment Station at Cornell University, and connected with Cornell for thirty years. Prof. Roberts is one of those genial, story teling instructors who can sugar coat the most difficut and disagreeable work so that it becomes a genuine pleasure to listen to him. To him was given the honor of delivering the first address of the institute.

### Advice from a Sage.

In referring to the fact that the United States now has six million farms with twenty billion dollars in farm property, the speaker said that our agricultural exports are not keeping up with the growth of the country. Of course, the country has practically had only one hundred years of agricultural development, and if in this time such an immense industry has been built up, it should spur us on to greater development in the future.

One of the greatest steps to be taken, he said, was in soil conservation. The grain grower who hauls 100 bushels of grain to market, hauls with it $20 worth of his soil. This is ruinous, if fertilizing material is not replaced. On many farms in California the average production of wheat per acre is only fourteen bushels. If this is the average, of course many give less. If this is much longer continued, will it be possible for us to produce sufficient wheat for our own consumption?

Prof. Roberts emphatically urged the students not to graduate and then acquire mental dyspepsia from reading the usual daily paper. "Your student life begins after you leave school. Acquit yourselves like men, and above all, get wisdom."

"Two things," Prof. Roberts said, "must be learned: (1), the petty details, the necessity for which every student must appreciate, but don't let them dominate your life; after these are mastered, then (2) see the larger things. Stand off and view in perspective. Get a general idea of the world."

### Stock Judging.

The judging of dairy breeds was conducted by F. D. Hawk, of horses, beef cattle and sheep by Howard Philips, both reguar instructors at the farm. All who wished were invited to join in the judging. Score cards were given out, and when the visitors had taken fifteen minutes or so to judge each animal, the instructors called for decisions, and it must be admitted there was some very good judging, according to the final decisions of the instructors. The judging was on the basis of a good breeding animal. Questions were also asked as to estimates of weight and age, and instruction was given on these points. The lines generally accepted as typical of the good dairy cow, were explained, as were those of beef cattle, horses and sheep.

### University Farm Students Association.

Students who have attended short courses at the college held their second annual meeting on Tuesday. This association serves the double purpose of binding together those who have attended the institution and of fostering any efforts toward the advancement of agricultural education in the state. The former officers were re-elected: W. O. Russell, president; F. S. Daniels, vice-president; L. W. Walton, second vice-president; and A. J. Gaumnitz, secretary and treasurer. The executive committee is composed of Messrs. Jeffries, Walton, and Alemedi. Judge Shields made the annual address to the members.

### Judge Shields.

Judge Shields believes in teaching affirmatively and not everlastingly by don'ts, but by

# A Wonderful Discovery in Refrigerating Without Ice or Chemicals

## Describing Newly Invented Cooler Run With Very Little Expense

A most valuable improvement in refrigerating is the invention of Mr. N. F. Anderson of Los Angeles in the method of preserving milk, butter, eggs, fruits and vegetables.

The milkhouse, as it is termed by the designer and builder, as you can note in Figures 1, 2 and 3, consists of a concrete structure with double walls and floor arranged with air and water chambers, through which air is kept in constant circulation and water constantly flowing, if necessary, thereby causing the temperature on the inside of the structure to be reduced sufficiently to make it an ideal refrigerator, in which milk can be kept sweet for days, butter never can get rancid, when made right, eggs will retain their freshness indefinitely, fruit and vegetables can be preserved until a profitable market opens for their disposal.

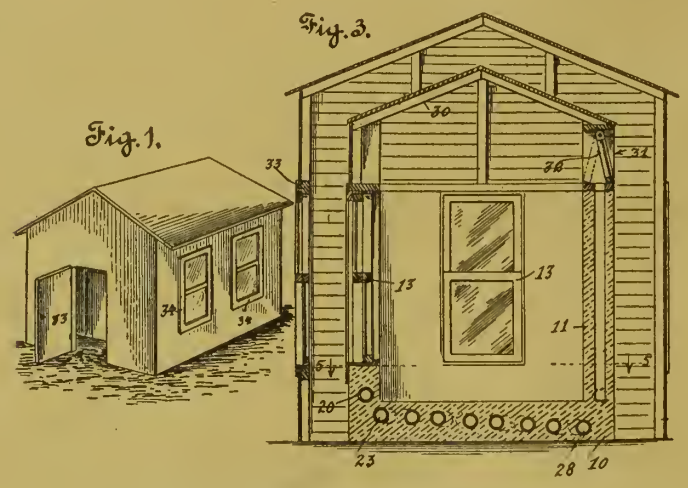

FIG. 1.—A Perspective View of Complete Structure.
FIG. 3.—A Sectional Plan View of Structure.

With this source of refrigerating, ice and chemicals have been dispensed with entirely, which within itself is a tremendous saving in time, labor, money and innumerable in conveniencs. The temperature can be so regulated by the operator that it is a pleasure rather than a burden to operate it, which can be done by a child. Mr. Anderson wishes to tell the public that the cost of constructing this refrigerator plant is very cheap and when once constructed can be operated with but little expense—practically none at all. It is neat, attractive and sanitary, and will last for all time in any climate in the world as has been tested. This refrigerator is bound to refrigerate. By proper structural arrangement this refrigerator can be built and kept where the sun shines the strongest and still be relied upon to do its work of preservation.

One of the most valuable uses to which this refrigerator can be put is that in freezing weather, by the use of ordinary water in its chambers, the temperature may be kept above the freezing point, thereby keeping the most delicate fruits and vegetables from being injured by frost.

Mr. Anderson has herewith given the readers of the Cultivator information enough for them to get a good idea of the wonderful merits of his invention, "the refrigerator" that cannot be claimed by any other refrigerator on the market, and is ready to fill all orders. He will take contracts for building same or will sell for a limited time only, blue prints and full specifications for building same for $5.00, or will send diagrams and specifications showing every detail for a limited time for 50 cents. Mr. Anderson will gladly answer all inquiries pertaining to his refrigerator. Address all communications to Nelson F. Anderson, 4531 Staunton Ave., Los Angeles, Cal.

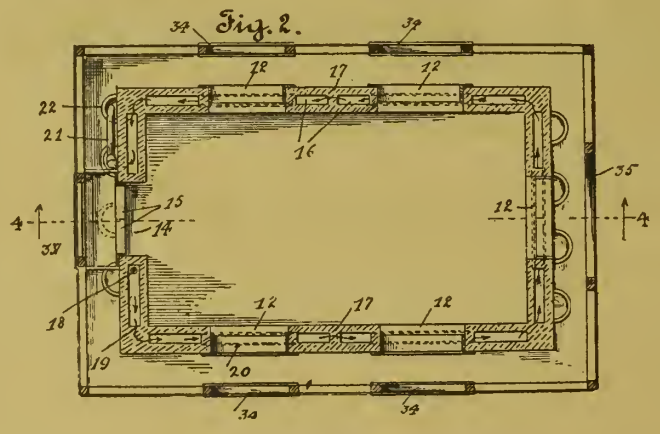

FIG. 2.—A Cross Sectional Elevation of the Structure.

# Citrus and Sub-Tropical Fruits

### SCALY BARK OF CITRUS.

SCALY BARK has been found to be quite destructive to trees of the sweet orange, in at least one of the important citrus-growing sections of the State. The heavy losses occasioned by this disease during the summer and fall of 1906, led the Experiment Station to take up the investigation of this trouble, with the view of ascertaining its cause and finding a remedy. A general account of these investigations is given here, together with recommendations based upon them. A description of the disease with its relation to withertip is also included. It is intended to follow this preliminary report with a more detailed account of the work.

Scaly bark as it occurs in Florida was described under this name in the annual Report of the Florida Experiment Station for 1907, and in the Proceedings of the Florida State Horticultural Society for 1908. Previous to this, H. H. Hume, in a paper on the diseases of citrus, in the Proceedings of the Florida Horticultural Society for 1901, p. 64, speaks of a new disease of the orange; and it appears from his description that the disease referred to was scaly bark as it occurs on small branches. Mention is also made of scaly bark by P. H. Rolfs in the Proceedings of the same Society for 1905, p. 32. A disease of the citrus trees in California, known by the same name, has points in common with the one in Florida.

**Description.**

This is primarily a bark and rind disease of the sweet orange. The wood is only affected secondarily, by poisoning due to the withertip fungus. The bark of the trunk and of branches of all sizes may be affected; but the greatest injury is done to the younger branches and twigs up to about one-half inch in diameter, and to the fruit.

**Scaly Bark of Branches.**

On the branches and twigs there develop more or less circular or oval spots one-sixth to one inch across, rusty in color, and with well-defined margins. The bark becomes brittle, begins to crack, and forms small flakes or scales. These spots are at first scattered, but may increase in number to such an extent as to become joined together. The branch is rarely killed in the first year. During the second year, additional spots form between the old ones, and this may go on for several years until the branch is finally girdled at some point and killed.

The development of the spots from their first appearance to the stage just described, is slow as compared with many other diseases. The spots first make their appearance on branches six to nine months old, or older. On branches younger than this, spots rarely occur. The first indication of a diseased spot on a branch is a slightly raised band or ring one-sixth to one-quarter inch in diameter. In many cases this band is composed of small dots or pustules that appear to have broken out from under the green bark. A small point also appears near the center of the spot. In other cases the beginning of a spot is marked simply by a lemon-colored area, which at its first appearance is nearly the size of the fully matured spot. The bark on the affected area gradually becomes rust-colored, hard, and brittle, and in the course of eight or ten months presents the appearance described above. On new spots only the bark appears to be affected. A new bark is formed under the old as the latter cracks and flakes off. As the spots develop, the withertip fungus comes in as a secondary agent, and poisons the wood, causing the limbs and branches to die. Larger branches, when not too badly diseased, may live on for many years. The bark on these limbs becomes very rough and shaggy, so that it shells off as the hand is passed over it. The outer bark is constantly breaking up into flakes, and an irregular new bark is continually forming under the old.

**Scaly Bark of Trunk.**

This formation of rough scaly bark is also seen on the trunks of badly diseased trees. As time goes on, the trunks present an extremely rough and shaggy appearance. Pieces of bark one-half inch or more in size are pushed up, sometimes over areas of several inches in diameter, or a continuous surface of ruptured bark is formed. New bark arises under the old, and only rarely do dead areas on the trunk result from this disease. The exudation of gum is a usual accompaniment.

**Scaly Bark on the Fruit.**

On the rind of the fruit the spots develop somewhat similarly to those on the small branches. The disease affects only the outer portion of the rind. The spots start either as rings, like those on the small branches, or as round yellowish areas. These usually begin to appear on the fruit in July and August. As the fruit approaches maturity, and while it is still green, the rings become sunken and brown, because of the entrance of the withertip fungus, while their central portions remain green. The fruit then colors rapidly, the portion inside the ring sometimes remaining green for a short time. The center is finally broken down by the withertip fungus, and the whole spot becomes brown. Some spots are formed which are not ringed. Fruit spotted by scaly bark colors prematurely, and drops before the picking season. Occasionally gummy exudations occur at the spots on the fruit.

**The Disease Infectious.**

Scaly bark appears to be infectious. There are reasons to believe that it may spread from tree to tree, and be carried from one grove to another. The history of the disease, as told by several old citrus growers, also points to this conclusion

**Technical Study.**

Studies both in the laboratory and in the field have been carried on to determine the primary cause and to find a remedy for the trouble. Studies of the diseased areas with the microscope and in cultures have so far failed to reveal any organism regularly present within the diseased tissue, except the withertip fungus (Colletotrichum gloeosporioides), and this only in advanced spots. It would appear that not until withertip began to be general in the State, did the scaly bark disease assume any importance. Experiments for the control of the disease have been systematically carried on at Bayview for the past two years. The results obtained have been deemed of sufficient value to be placed before the citrus-growers for their consideotion. The nature of the disease and its slow development upon the limbs and trunks, make the effect of any line of treatment slow in showing itself. As the development of the disease to its destructive form is slow, so the recovery of the tree after the source of infection is cut off requires a long time. We cannot expect to see the beneficial effect of any treatment on the branches in much less time than eight to ten months. Twenty experiment plots, each receiving different treatment, were laid out. These have been continuously under observation, and form the basis for our conclusions.

From the results of our observations and experiments we are prepared to suggest one of the four following remedies.

**Top Working Affected Trees.**

Grapefruit, mandarins, and tangerines appear to be nearly immune to scaly bark, even when surrounded by badly affected sweet orange trees. Diseased trees may therefore be top-worked to one of these varieties. At first sight this would seem to be too severe a remedy; but. as a matter of fact, it can be carried out without serious loss at any one

time. This can be done by treating only alternate trees in a row, or by treating alternate rows. In this way the untreated trees will be found to produce a much larger crop, and this will in a measure compensate for the loss of crop on the top-worked trees.

During December or January, before any spring growth has started, cut off all the large limbs as for ordinary top-working. Then top-graft the trees. If the grafts fail to take, the sprouts that start from the large limbs and body of the tree can be budded at the proper time. Top-working has already been practiced by some growers. As a further precaution, the trunks and branches may be treated with carbolineum as suggested in remedy No. 2. When these top-worked trees begin to produce a fair crop, the untouched trees may be treated in the same way.

If the grower does not wish to be constantly annoyed by sprouts coming from the lower part of the tree, the trunk may be sawed off at the ground and crown grafts put in. This, however, will require a year or more longer to secure a tree in good bearing.

### Heading Back.

During the dormant period, preferably in December or January, cut out the top, leaving only the trunk and the stubs of the larger branches. Then paint the entire bark and the cut surfaces with one part of carbolineum to one part of water. In our treatment of the disease in this way, which began in February, the bark assumed a dark-red color. In a few weeks, as the growing season came on, the tree put out new shoots, and by the end of summer had grown a vigorous, healthy top. By that time the old scabs had disappeared, and the bark had become smooth and free fromflakes. The carbolineum, far from injuring the tree, appeared to stimulate it to increased vigor. Unless the entire grove is treated in this way the young growth should be protected by spraying with a 1 per cent. solution of carbolineum in May or June, when the wood will have hardened.

### Pruning Out.

This is a less drastic and less effective method. Prune out thoroughly all dead branches and weak limbs, and spray with a dilute solution of carbolineum Use a 1 per cent. solution during the growing season. Any strength up to 5 per cent. may be used in the dormant season. The 1 per cent. solution is made as follows: Dissolve 3 pounds of soap in 2 gallons of water, add one-half gallon of the best grade of carbolineum, and make up to 50 galions. The carbolineum diluted in this way is not at all injurious to the hands or face.

### Bordeaux Mixture.

The use of Bordeaux mixture has been attended with beneficial results in diminishing the number of spotted fruits, but with bad results in allowing the increase of scale insects. A thorough test was made as to the effects of this spraying mixture at different times of the year, and with different numbers of sprayings throughout the year. The most marked result has been the diminished number of spotted oranges on the sprayed plots, as compared with the unsprayed plots. This test was repeated in the second year on the same plots and in the same way as at first. During the first year some effect was noticed, especially on those plots where the spraying had begun early in the summer, but the results were not pronounced. During the second year a great diminution of spotted fruit was seen in nearly all of the sprayed trees. The amount of fruit, however, was considerably diminished on the plots sprayed at or near the blooming season. Our experiments indicate that one thorough spraying at any time between November and February is almost as efficient in diminishing the amount of spotted fruit in the following crop, as three or four sprayings during any other part of the year. It is also attended with a smaller increase in scale insects.

### Important Facts.

1. With changed conditions, previously unknown or insignificant diseases of cultivated plants may become destructive.

2. Scaly bark, though long present, has but recently become sufficiently important to demand attention.

3. Scaly bark did not attract much attention until after wither-tip became general. Its destructiveness was increased through the secondary agency of the wither-tip fungus.—H. S. Fawcett of Florida Exp. Sta.

Save for the Home at the Home Savings

**Your Money Grows Here**

You draw out more than you put in when you become a savings depositor at this Home Bank. Your profit is definate, sure, constant. Every year is a prosperous one. Begin now. Keep your surplus funds at work.
